The whole work is written in a plain and forcible style, and pictures the early morality of some of their early laws, manners and customs.

We think the title page given below will amuse our readers, and the description of California one hundred and eighty-five years ago, be as interesting as anything we can place before them.

TITLE PAGE.

A M E R I C A ,

Being the latest and most accurate description of
THE NEW WORLD,

Containing the original of the inhabitants, and the remarkable voyages thither—the conquest of the vast Empires of Mexico and Peru, and other Provinces and Territories, with the several European Plantations in those parts. Also their Cities, Fortresses, Towns, Temples, Mountains, and Rivers. Their Habits, Customs, Manners and Religions. Their plants, Beasts, Birds and serpents; with an appendix containing, besides several other considerable additions, a brief survey of what hath been discovered of the unknown South-Land and the Arctic Region.

Collected from the most authentic authors, augmented with later observations, and adorned with maps and sculptures.

By JOHN OOLBY, Esq.

His Majesty's Cosmographer, Geographic Printer and Master of the Revels, in the Kingdom of Ireland.

LONDON :

Printed by the author, and are to be had at his house in White Fryers.

M. DC. LXXI.

California.

"We shall close up our discourse of these islands that lie north of the Equinoctial line, with a discourse of California, specially so called, which was by many thought and described to be a peninsula or half island, by reason of the bay which divides it from Quivivian and New Gallacia towards the north, runneth much narrower than it doth sontherly, which made them think that somewhere or other at the north it was joined to the main land of America. But later discoveries have found it to be a perfect island and altogether separate from the continent; for about the year 1620, some adventurers beating upon those coasts northward, accidentally, and before they were aware, fell upon a straight, the waters whereof ran with such a torrent and violent course that they brought them into Mar Vermiglio, whether they would or no, and before they knew it, and by that means discovered that California was an island, and the waters that were observed to fall so violently into that sea towards the north, were not the waters of any river emptying itself into the bay from the main land, as was formerly thought, but the waters of the northwest sea itself, violently breaking into the bay and dividing it wholly from the continent. It lieth north and south, extending itself in a vast length, full twenty degrees of latitude, viz: from twenty-two to forty-two; but the breadth nothing answerable.

The most northern point of it is called Cape Blaenche; that to the south, Cape St. Lucas, memorable for that rich and gallant prize which Capt. Cavendish, in the year 1587, being then on his voyage about the world, took from the

Spaniards near to this place. As for the island it is at present little, if at all inhabited by the Spaniards; whether it be that they want men to furnish new plantations, or that they find no matter of invitation and encouragement from the country, or perhaps that the acres thither be not so easy: for it is reported to be wonderfully well peopled by the natives, and that there were found only upon the coasts and along the shore of Mar Vermiglio, twenty or twenty-three nations, all of different languages; though from the peculiar narrations that have been made of the voyages of several eminent persons into these parts it appears that the Spaniards have taken great pains in the discovery thereof, and also from the several Spanish names of places, that they have had plantations here formerly, however neglected at present.

The country is abundantly well stored with fish and fowl, as appears partly by the natives, who take a huge pride in ninking themselves gay with the bones of the one, with which they load their cars, and sometimes their noses also; and with the feathers of the other, which ordinary people wear only sticking about their waists, but great persons and such as will be true indeed, beset their heads strangely with them, and have commonly one bunch bigger than ordinary hanging down behind them like a tail.

Having no knowledge of the true God, they worship what the devil will have them, the Sun, attributing to it only the increase of their plants, healthful seasons, and most of the other good things they enjoy, or are sensible of.

Their government is said to be only oeconomical, each father ordering the affairs of his own family apart, without subjection to any Superior; yet so well managed that they live in good peace one with another; not without many good laws and customs, viz: They allow but one wife to one man; that they punish adultery with death: that they suffer not maids to talk or converse with men till married; that widows may not marry till they have mourned one half year at least their husband's deceased; and divers others of like nature, which perhaps if the truth were known, do more properly belong to the natives of Utopia, or New Atlantis, than to these of California.

The places therein as yet observed, are only upon the south coast.

1. The Capes of St. Clara and St. Lucas, the one at the south-east end of the island, looking towards New Gallacia, the other at the south-west, looking into the sea, and towards Asia.

2. St. Cruce, so named from its being first discovered on Holy Rood Day, being a large and convenient haven, not far from Lake St. Clara.

3. Cabo de las Playas, so called from a compaay of little bare hillocks appearing from the sea, and is more within the bay.

4. Cabo Baxo, so termed as laying towards the bottom of the Gulf.

5. St. Andrews, another convenient haven upon an island of the same name.

6. St. Thomas, an island at the mouth of the Gulf or bay, of about twenty-five leagues in compass, rising southerly with a high mountainous point, under which is a convenient road for shipping, and twenty-five fathoms of water.

On the other side of the island, towards the main sea, there is

1. St. Abad, a good haven, and almost surrounded with a pleasant and fruitful country.

2. Cape Trinidad, a noted Promontory.

Cape de Cedras, so called from the store of cedars growing thereabouts.

4. Enganna.

5. Puebla de las Canoas, so named from the abundance of those little boats which the Americans generally use and do call canoos, whereof perhaps some store are made there.

6. Caho de Galera, from its resemblance to a rat.

It is believed there are many more promontories and bays on both sides of this island, besides rivers and islets, yet not named and altogether unknown. Moreover Dr. Heylitt hath well observed, that those above mentioned are the names only places, and not of towns and villages, though doubtless there must needs have been some scattered houses built formerly by the Spaniards in so many expeditions.

The first discoverer of these parts was Ferdinando Cortez, who having in the year 1534, set out two ships for that purpose from St. Jago, a haven of New Spain, and not finding the success answerable to his expectation, went next year himself in person, and passed a good way up the gulf, but for want of provisions was forced to return without having done anything to the purpose.

In 1539, one Francisco, a companion of Cortez in the former expedition, set out upon his own charges, and having coasted all about, both upon the eastern and western shores he at last landed, but not without notable opposition from the natives, who with much clamour and many antique gestures set upon his men, and so furiously with stones and arrows, that they had met with a shrewd repulse, had it not been for the valor of their auxiliaries, the mastiff dogs, which it seems they used to carry along with them in those kind of voyages; but at last he got footing so far that he took possession in the name of the king of Spain with the usual formalities; and following the example of Columbus set up a cross in the place for a memorial and testimony of his having been there.

Much about the same time Marco de Nisa, a Franciscan undertaking a voyage into those parts, reported wondrous at his return of the plenty of golden mines, stately cities, set out with magnificent buildings, the very gates whereof were enriched with turquoises, and other precious stones, and whose meanest inhabitants went glittering in gold and mother of pearl, and of the flourishing condition of the kingdoms of Aen, Tontea, and Matara; whereupon the Governor of New Gallacia was sent by the then Vice-Roy of Mexico, with great hopes of these reports; but whether out of spite to be deceived in his expectation, or having real cause so to do, he represented all things as mean and despicable, as the Fryer had proclaimed them rich and glorious.

The next that went upon the Design was Ferdinando de Alcaron, who is reported to have sailed many leagues up a river called Buena Guia, and there to have received homage of Nuguantus, one of the heads of the Californian tribes.

One more attempt was made in the year 1642, by Rodrico Cabrillo, who discovered the Island of St. Luke and another called the Island of Possession: and this was the last we hear of that thought it worth while to go to an undertaker to those coasts, and ever since all undertakings hither have been wholly laid aside, that whatever was once discovered in those parts, seems rather to be lost and forgotten, than any way improved.

As for Nova Albion, whereas many determine it to be the utmost northern part of California, though it doth not absolutely appear to be so from the relation of Sir Francis Drake's discovery of it, we judge it agreeable to method and decorum, not wholly to omit the mention of it in this place, though it hath been already spoken of, and the aforesaid relation delivered at large amongst the rest of those provinces of largely-taken California, which were taken for granted to be upon the continent.

Drake and his company brought home this description of the country and inhabitants, viz: That the country was exceedingly well stored with deer, grazing up and down the hills by thousands in a company; that the men generally went naked all over, the women using a piece of a mat or some such thing instead of an apron; that their houses were built only of turf and osier, yet so wrought together, that they served very well to keep out the cold; in the midst of it was their hearth where they made their fire, and lay all round about it, together upon several beds of bull rushes. What their towas were or whether they had any is altogether unknown.

MINING ABOUT YREKA.—On Yreka Creek, in the vicinity of the Gas Works ditch, we observed a man washing with a rocker who is reported to be making a good thing. On the opposite side we also noticed claims staked out for working. On the gulches west of town, considerable good sluicing has been done lately. And good pay is anticipated. One man picked up one hundred and five dollars, a few days ago, in a gulch west of town, and spent it all in a jolly good spree.—Yreka Journal.

HUMBOLDT MINES.—As an evidence of the great richness of the rock found in the Humboldt silver mines, the Enterprise says that tons of it are being hauled to Virginia city for crushing and that it pays well for the trouble, though the distance cannot be less than a hundred and fifty miles.

CALIFORNIA.

Los Angeles county.—The Star says:

We have noticed a paragraph going the rounds of the papers, to the effect that an Indian in the year 1811, brought a quantity of quicksilver to one Father Gouzeaux, a Spanish Missionary and told the Priest, that there was a lake of this "heavy water" in his country, and it was supposed the Indian came from the present San Bernardino county. The existence of quicksilver in Bear and Holcombe Valleys, San Bernardino county, has long been known and it is used extensively in mining operations there—no importation of the article, we believe, ever being made, but on the contrary considerable quantities being exported. In 1856 it was stated that a man (whose name we do not remember) in prospecting about the mountains in the vicinity of San Bernardino, had discovered a mine of quicksilver. He advertised for competent workmen, and went to San Francisco to procure the necessary machinery to successfully develop the discovery. But before the matter ended, so far as we have any knowledge. Several experienced workmen in quicksilver mines went to San Bernardino, in answer to the advertisement, but what satisfaction they received we do not know, but certain it is that they were not employed. We have been informed of many prospectors and residents of Holcombe Valley, that in numerous places in the mountains surrounding the valley, they have discovered little pools of quicksilver in the hollows and crevices of the rocks, and sometimes scooped it up in their hands. We have no doubt that the eye of some adventurer will rest upon the exact locality of an abundance of this much valued article of commerce, in his wayings up the Bear and Holcombe Valley mountains, and at a time not far remote.

Sierra county.—The Messenger says that the New York Tunnel company, near Lopoite, struck a quartz nugget weighing \$272.11 on Christmas day, another one weighing \$244.12, was subsequently found, besides smaller lumps of such a matter as fifty dollars, or somewhere thereabouts—mere small tracts.

BRITISH COLUMBIA.

Mr. Levi arrived at New Westminster, from Cariboo, on the 4th inst. He left the Forks of Quenneville river on the 1st of last month, came down by the river trail, and was twenty-four days in reaching New Westminster. The Brigade trail is choked up with snow, and rendered impassable. A thermometer at the Forks, on the morning of the 1st inst., stood eighteen degrees below zero; and at Beaver Lake on the following day, twenty-seven degrees below zero. Snow laid on the ground to the depth of three feet. All the trails were impassable for animals, and our informant footed it to Lillooet. In the diggings nothing was doing. The snow was very deep on Antler creek where twenty-five men are wintering. At the Forks there are about one hundred and fifty men. The total number of persons in the whole country will not reach one hundred. An expressman was met at Abbots Lake on his way up with letters and papers. But few animals had died at the lakes, and they were mostly worn out before the cold weather commenced. Provisions were in good supply at the Forks for the present population: but if a rush to the mines occurs early in the spring, there will be a scarcity, business as a matter of course was very dull.

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street, near the Gas Works, San Francisco Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc. The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought-iron framing. 1615

We have for sale, together with an immense variety of Works in every department of Literature, the following, any one of which will be forwarded by Mail or Express as desired:

- A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. By John Arthur Phillips, F. C. S. Illustrated.
- A Treatise on Metallurgy, Comprising Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman, Mining Engineer. Illustrated with 377 wood engravings.

Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlington. Illustrated.

Manual of Practical Assaying: Intended for the Use of Metallurgists, Captains of Mines, and Assayers in general. By John Mitchell, F. C. S. Illustrated with 360 Engravings.

A System of Mineralogy, comprising the most recent Discoveries; Including full descriptions of Species, Chemical Analyses and Formulas, Etc. Etc. By James D. Dana, A. M. Illustrated with 600 Engravings.

Elementary Treatise on the Metallurgy of Copper. By Dr. Robert H. Laneborn.

The Discovery and Geology of Gold Deposits in Australia, with comparison of the Gold Regions in California, Russia, India, Brazil, Etc.; Including a Philosophical Discussion on the Origin of Gold in Placer Deposits, and in Quartz Veins. By Simpson Davison.

Books imported to order on short notice.

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends there wish disinterred, are informed that I have the most complete registry in existence of graves in that cemetery, having added to my own records by purchase, the books of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California.—on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals; their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3d. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—(Morning Call.)

THE MINER'S COMPANION.—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, metallurgist, geologist and assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter, of 30 pages, treats of assaying. These three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies several pages. The last chapter, of 10 pages, contains a glossary of the technical phrases used in the work. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—(Alpha California.)

A BOOK FOR THE MINERS.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which is here quoted at length, fully indicates its character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—(Herald.)

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work is the "Miner's Companion and Guide, and Treatise of California Mines exclusive." It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and doubt will meet with great sale.—(Sac. News.)

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will to doubt meet with ready sale, throughout our mining towns for its merits and usefulness. We earnestly commend it to those who are practically interested in bringing to light from Mother Earth its hidden treasures.—(Union Temperance Journal.)

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the for years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 3 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty two per cent., against two per cent. wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,27 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths fine. 3cts per oz
" from 300-1000ths. to 750-1000ths fine. 7cts " "
" " 750-1000ths to 950-1000ths " .14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce 1/2 per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1.16-4-11ths cents. per standard ounce, 1/2 per ct. gross value of silver for making bars; also when gold is contained 1/2 per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1.21cts. per standard oz. 1/2 per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1.16-4-11ths. per standard oz. 1/2 per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1.16-4-11ths. cents per standard oz. 1/2 per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of 1/2 per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to the extensive establishment, we can confidently announce to the public that we now have
the Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, all Marine and Stationary; Straight Quartz Mills of all sizes and kinds; Stamp Mills and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gangs, in, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines is now in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hunsman's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now used.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Cut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lion's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Shambout work promptly attended to. Thankful to the public for their many past favors, we would respectfully invite a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Minor expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Barfala Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson, }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work. The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is made of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- 12th. We invite Farmers wishing a machine to call and see before purchasing.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munitt & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interests of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM BEN. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the Inventors of the United States.

J. H. APPENDATE, Secretary.

FIELDHOUSE'S VITRIFIED CLAY PIPES FOR MINING PURPOSES.

We are extremely well pleased with the introduction and introduction of a new style of pipe, long since celebrated for its durability, cheapness and its particular adaptation to mining purposes. A few days since we examined some specimens of this pipe in various forms and shape, at the agent's office—Mr. Hubbard, of the Pacific Mail Steamship Company, corner of Leidsdorff and Sacramento streets.

The mining community, especially those of placer or hydraulic claims, will have no further difficulties or great outlays in conveying any stream of water, or from any given distance, as heretofore encountered. We are assured by Mr. Hubbard that one mile of six inch pipe can be furnished by him at the nominal cost of seven hundred dollars. We are also satisfied if the same mile were made of cast iron, or of sheet metal seven hundred dollars would not cover the cost; thus have we within our reach an invaluable but cheap medium for conveying water, and which has heretofore been a material defect in our mining pursuits.

The facilities for applying said pipe are manifold. The principal cities in Europe and America apply them for sewerage and other purposes.

In a pamphlet before us of the relative strength, amount of friction, pressure, etc., according to the size and calibre of this pipe, we are of belief that very shortly its exclusive use in mining operations will ensue. We represent in the above neat engraving nine different devices, although the same firm manufacture hundreds of different styles, and to suit every purpose. The material is of a superior Scotch clay and is glazed inside and outside, which causes the pipe to have little or no friction.

Figure I. Shows a double junction.

Fig. II. Shows a single junction, (oblique.)

Fig. III. Shows socket pipes in 2 feet lengths—from two inches to 30 inches diameter.

Fig. IV. Shows half socket pipe, from 2 inches to 30 inches diameter.

Fig. V. Shows a whole socket, " " " "

Fig. VI. Shows ring pipes, for resisting internal pressure.

Fig. VII. Shows "Y" junction.

Fig. VIII. Shows an elbow.

Fig. IX. Shows a house-top chimney, of which some nineteen different styles are represented in their circulars.

One of our City Water Works have ordered several miles of this pipe, which will be forthwith laid down in the places designed.

Mr. Hubbard is also the agent for Mr. Eli Blake's Quartz Crusher, a most invaluable machine for this coast. In our next issue we shall give an illustration thereof.

Our Mines and their Prosperity.

In an article recently published by us in the Press we gave some interesting facts and statistics which materially tend to verify the remarks made by the Marysville Express:

The experience of the past few years in California conclusively demonstrates that the mines in this country are exhaustible, that before many years come round the mining interest of this State will become one of our most unimportant sources of wealth.

We may ridicule the idea that the gold regions of California will have poured out all their immense quantities of treasure before a quarter century has passed away; but those thus thinking should revert their memories to the early days of the State's golden history. We may be reminded that the treasure shipments to the East are as large as they ever were; that despite the discouraging news from the Atlantic States, which daily reaches our shores our mines are being worked with cheering success, and that at the present time California is contributing as liberally as at any former period to enrich the older States. But while we become rejoiced at the thought of our mines' enormous yields, that fortunes are yearly being made in our tunnels and hydraulic mines, we forget that the amount of capital and labor expended in de-

veloping our diggings is at least ten times as much as that employed in like pursuits in 1849, and '50. We forget that wages have been reduced; that fortunes are not found in gulches in a week or a day; and that the labor of fifty men, at the hardest kind of work, is required in getting out an amount of gold that two men, with the assistance of rockers, could in olden times, extract in a few hours.

We are no longer in possession of placer diggings, in which the adventurous miner was able to test his good or bad luck in a few hours' labor. Our creeks and rivers continue no longer to roll out their ariferous treasures at the will of the fortune-hunter, this branch of mining being almost exclusively under the superintendence of the despised Chinaman at present.

For an evidence of the fact that the mining interest is decreasing in importance, let us look at the many mining towns and camps, once stirring places, that are now almost tenanted. The work of desolation remains to tell a gloomy story of the towns of the Middle and Southern mines; and even those of the Northern diggings, included a few years since among the permanencies of the State, tell us forcibly that California in a few years must trust to other interests for future greatness than those of mining.

To-day we easily find deserted mining towns, the relief of an old sign remaining to remind one that the shattered and weather-beaten building to which it was once attached was the hotel of the town; and near it stand the walls and a portion of a broken roof of what was once a first class gambling house. In the days of this deserted town's prosperity when the diggings were fabulously rich, yielding fortunes to a few lucky ones as the result of no great labor, the diggings were regarded exhaustless, and he who dared to believe that the town was not a permanent institution was set down as a false prophet. But the diggings were worked out in the course of time, and the miner who had not accumulated his fortune in prosperous days was compelled to hunt for newer places, while the lucky one often left with his money, to invest it in ranch property, or some mercantile business which was dependant upon agricultural and mechanical resources for its success.

There is not a mining county in California that has not its share of worked-out diggings and deserted towns and hamlets; and all the agricultural and grazing portions of the State have received a large share of benefits of wealth taken from diggings which are now exhausted.

Persons living in the mines are too often foolishly sensitive on the subject of a decrease in the mining interests of the country, thinking that jealousy among those in the valleys, prompts them to underrate the importance of our mining wealth, and at the same time forgetting that our success to a great extent depends upon the good fortune of those who laboriously delve the mountains for gold.

Disguise the fact as we may, battle mentally as we will, against the order of things which must in course of time be brought about, we cannot but see that the mining interest is yearly degenerating in importance, and that before many years it will become a thing of insignificance.

The fictitious value at present attached to mountain property will depreciate; many now engaged in mining pursuits will take those less arduous, less speedy, but surer in fortune accumulating; many will repair to our valleys to procure permanent homes, and a large number will successfully devote their attention to cultivating, for agricultural purposes, the mountains and foot-hills, which in the present search for gold are regarded worthless for other purposes.

For Sale.

A great bargain is offered by a person who spent the past summer in the silver mines east of the mountains. Eight hundred feet in various excellent quartz lodes are offered for sale for a paltry sum—sufficient to enable him to make a trip to Cariboo.

For particulars apply at this office.

PACIFIC METALLURGICAL WORKS.

NORTH BEACH,

Are now prepared to reduce by contract, Gold or Silver Ores or Sulphure. Price of reducing will be as low as the charge of similar establishments Europe or in the States, thereby saving freight, insurance and interest.

UNION IRON WORKS (ESTABLISHED IN 1849.)

N. E. Cor. First and Mission streets, San Francisco.

PETER DONAHUE, PROPRIETOR.

THE above Establishment has been in successful operation for the last twelve years, during which time new and extensive Buildings have been erected, and the latest improvements added to the Works, which enable the undersigned to supply all demands for

BOILERS, MACHINERY AND CASTINGS,

Of every description, on the shortest notice, and finished in a style of workmanship that cannot be surpassed.

Quartz Mills, Saw Mills, Threshing Machines, Horse Powers, Grist Mills, Gearing, Malt Rollers, and all kinds of Mill Work, Steamboat Repairing and Blacksmithing, etc.

STEAM ENGINES BUILT AND REPAIRED.

Besides the extensive assortment of Machinery, Patterns, attention is called to the new and beautiful designs for Building Castings, Iron Fronts, Columns for Stores, Railings for Balconies and Stairs, Door and Window Sills, Stair Cases, Etc.

P. DONAHUE'S SAFETY STEAM PUMP AND FIRE ENGINE.

C. & G. M. WOODWARD'S PATENT.—This Pump is used for supplying Steam Boilers, Mills and Public Buildings, with water. In case of Fire it is arranged to discharge any quantity of water, according to the size, by simply opening a valve connected to the Discharge Outlet. It is suitable for both Maritime and Mining purposes, being used on nearly all the Government vessels lately built, and in Mining operations is used for raising water from shafts, driving Quartz Machinery, etc. ORDERS PROMPTLY FILLED.

PETER DONAHUE, Proprietor.

OILS AND LAMPS BY LATE ARRIVALS.

STANFORD BROTHERS HAVE RECEIVED

A GREAT VARIETY OF COAL OIL LAMPS of every style of BURNER known to the trade.

BRACKET LAMPS AND SIDE LAMPS with the largest burners in use. PARLOR AND STAND LAMPS.—An endless variety of Patterns. CHAMBER LAMPS AND HANDLE LAMPS—Very cheap; may be carried about.

CHANDIEIERS AND LANTERNS.

CAMPBELL LAMPS OF ALL KINDS.

COAL OIL AND CAMPBELL WICKS.

CHIMNEYS, SHADES, GLOBES—Of every size, style and finish.

200 BARRELS SPERM OIL—At a lower price than ever before sold in this city.

100 BARRELS LARD OIL—Of our own importation.

600 TUBS RAPE SEED OIL—In original packages.

100 BARRELS BOILED LINED OIL—guaranteed pure and free from fish oils.

400 CASES DOWNHILL'S KEROSENE.

800 CASES COAL OILS—At the very lowest market prices.

1,000 CASES CHINA OIL—In 2½ gal. tins.

We feel confident in assuring our CUSTOMERS and the TRADE generally, that they will find our assortment of LAMPS and LAMP STOCK, as well as of OILS and all kinds of BURNING MATERIALS, the most complete that has ever been offered on the Pacific Coast.

Our purchases have been made upon the most advantageous terms, and we are determined to fix our prices at a standard so low that dealers in our line of goods can lay in their Winter Stocks, and have a wider margin for profit than they have ever had before.

STANFORD BROTHERS,

121, 123 and 125 California street,—Near Front.

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, JANUARY 25, 1862.

NO 19.

CARL SCHUMACHER'S BREECH-LOADING FIRE-ARM.

We were led to believe that the promises heretofore made by a scientific cotemporary in the Atlantic States, that novelties in war engines and arms would materially engross their chief occupation. We have looked in vain for some time past through this exchange, and find the reported or alleged new invented firearms neither novel nor practicable.

But California seems to be more prolific for Scientific as well as practical inventions, than our much troubled inventors on the other side. The name "Schumacher," will hereafter rank among discoverers and inventors for his breech-loading firearm, pre-eminent. Like many of our Teutonic brothers, whose inventions tower like living monuments, so will this breech-loading firearm.

We have just sent to Washington the patent application, through the office of this agency, and, in so far as our knowledge of a truly ingenious and mechanical, as well as philosophical conception is concerned, it will take centuries to produce anything better. Its simplicity of construction and application, are features truly commendable. Should the Secretary of War order one half the number of arms constructed of these, instead of those ordered, we opine that "Secession" would be wiped out at least one year sooner than otherwise. To our military companies and the volunteers of this State we would say, by all means procure "Schumacher's Firearm." For sporting purposes it can at present have no equal. We have Sharp's; Burnside's; Wesson's; and a sea of other like inventions, which are thrown at once into the shade.

To illustrate more particularly the manner of operation and construction, we will presume that any kind of barrel may be provided as well as any kind of lock and stock. The great improvement made consists chiefly in the breech, as will be seen in the above illustration (Fig. 1). The cartridge chamber is opened for introducing the charge; (Fig. 2) shows it ready for use or discharge. One motion opens the cartridge chamber by a lever, and a similar motion closes the same, but in such a manner as to shut it perfectly air tight, as will be seen; the barrel end is made conical, having a shoulder, and the cartridge chamber has the corresponding recess and double shoulder, into which said conical end fits. This happy idea has cost the inventor fourteen years of his life, to effect a perfectly air tight breech-loading weapon. The lever with its socket, and coacting link of the wedge, against which the cartridge chamber rests, work exactly in the same manner as a knuckle joint. We shall be pleased to refer to this wonderful invention in a future number. The inventor is a resident of Humboldt County, in this State.

Any information respecting said arm can be had at this office.

General Barry's Rocket Battalion.

General Barry's Rocket Battalion, says the N. Y. Evening

Post, organized as light artillery, arrived in this city a day or two since from Albany, and proceeded to the seat of war last evening. This battalion is understood to be the first of its kind ever organized. The novelty of its plan of operations, the peculiarity of the apparatus employed, and the destructive character of the projectiles, combine to render the corps a destructive character.

The battalion is commanded by Major Thos. W. Lyon, and is composed of two companies, of eighty men each. One of the companies was enlisted in Niagara county, in this State, and the other in Wyoming and Monroe counties. The companies are commanded by Captains Ransom and Lee. Although the principles employed in the construction of these batteries, and particularly of the projectile, are kept entirely secret, and, as far as their use in this country is concerned, are government property, the following general details, derived from one of the officers of the battalion, may properly be published.

Each battery comprises four rocket guns and four caissons. The guns are of very peculiar construction, formed in sections which may be detached or united with the greatest ease. Each section consists of two rings or collars, to which are attached the ends of iron bars, spirally twisted, and the whole forming a tube. Three of these tubes united comprise the gun. No carriage is used, but in its place a stand, on which the gun may be elevated or depressed. This stand is light and portable, easily carried by one man. The gun is breech loading, and no charge need be used except that contained in the missile itself.

The rocket is of a very complex construction, made in long tubes. The largest are thirty-two inches in length. There are many sizes and various descriptions. The tubes have three or four chambers or compartments. The posterior chamber contains the powder which acts as the propelling agent. The others contain the explosive mixture, and a fuse is so arranged as to keep up the rotary motion communicated

by the spiral barrel, and at the same time to increase the velocity of the projectile. The rocket may be used as a fire ball, a percussion shot, or a bomb-shell.

The range of the rocket is from five hundred yards to five thousand three hundred yards, according to size and power. The smallest rocket weighs ten pounds, and the largest two hundred pounds. With the two hundred pound rocket, a mark no larger than the mast of a ship may be hit three times out of four, at a distance of three thousand yards. The firing can be very rapidly performed. There is much facility in loading, the rocket being inserted at the breech of the gun.

These rockets are ranked among the most terrible engines of war in existence. When the missile of medium size is in motion, a body of fire, fifteen inches in diameter, produced by the spiral passage, accompanies it, filling the air in every direction. It may be so arranged as to produce a continuous and almost inextinguishable fire, consuming every combustible substance with which it comes in contact; or it can be exploded in the air, falling in burning fragments. Or by fixing a percussion cap, may be made to burst at the instant of falling. Of course, being lighter, it has not the same power as the bomb-shell ordinarily used, but its destructive capacity is infinitely greater than a bomb.

Application of Excavating Machinery to Mining.

Nearly every department of industry partakes of the momentum with which the world is now moving forward. Science has touched with its potent wand agriculture, manufacture, and locomotion; "it has spanned great rivers and estuaries, intersected the land with iron, and traversed them with cars thirty miles an hour: ploughed the Atlantic fourteen knots an hour against the wind, laid bare the floor of the ocean, brought the fixed stars to our feet, annihilated space, and made a point inconceivably distant yesterday its goal to-day, and its starting point to-morrow;" but the progress of the miner in his patient burrowings through the indurated rock is precisely what it was when the Romans landed his legions upon our shores; or earlier yet, when Pytheas led his daring adventurers from Phoenicia into the rough latitudes of the British Isles. The miner knocks perseveringly at the prison-house of the shining treasure, and slowly is the gate opened—sometimes never, and often only when generation after generation of importunate besiegers have passed away. Occasionally, but only at rare intervals, the door which bars the entrance to the unrevealed hoards, flies open as if on the pronouncement of an "Open Sesame," and the adventurer thus suddenly endowed with wealth becomes the object of envy and emulation to thousands, who hazard their all upon a remote possibility, leaving behind them a painful moral, which might well adorn a tale.

These reflections have been suggested by the novel and startling proposition which appeared in last week's, of applying steam machinery as a substitute for hand labor in the sinking of shafts and driving levels and cross cuts. We have called the proposition novel, though such an idea must have often occurred to the reflecting miner, as that of steam, applied to manufactures and locomotion, to many a thought-

ful man before Watt or Stephenson, by their marvellous power reduced the theory to practice. The novelty however, in the present instance, arises from the form in which the proposal is placed before the capitalist and the world; it is startling because a new and magnificent prospect will be opened up to thousands in England, who know what science and capital have been achieved in other walks of industry. If steam machinery can plough our fields reap our harvests, spin and weave our raw cotton, silk, and flax, point a needle, rifle an Armstrong gun, or construct a frigate in a few days or hours, is it impossible that the same agent should take its stand in front of the granite forebreast of the miner's drift, and with twenty augers, urged onward by as many hammers, honeycomb the rock, and win its triumphal way with a giant's stride where the arm of the miner drops paralysed in the struggle? Only these will laugh who would have laughed at Trevithick, Arkwright, or Smeaton. Many a bold and successful project has found its inception in a Cornishman's mind, although in Cornwall as elsewhere, interest and ignorance will array themselves against an innovation, however great and beneficent the results promised by its triumph.

The inventor in the present instance offers to sink a shaft of two hundred fms. in twelve months, and drive a level at a minimum rate of a fathom per diem. And why not? If twenty men could stand in one end, or forty in a shaft, the work could be accomplished, but neither the prescribed space for the workmen, nor the atmospheric supply for the lungs of as many manipulators, admit of such an application of human power, to say nothing of the costly nature of human labor. But with machinery the case is altered, power is concentrated and augmented, and the crying evil of a poisoned atmosphere, which slays its thousands is absolutely corrected, or reduced to its minimum amount of mischief. Could such an agent be anything but a boon to the working miner? Would it displace his labor? Would it not augment it tenfold? Would not whole districts now abandoned because the ore is so sparsely distributed as to render the costly hand labor of the miner unremunerative, spring into activity, and give employment to thousands who have now to carry their skill and enterprise to the remotest regions of the earth, where mining may be found in that virgin state in which centuries ago it existed in our own country?

By the proposed substitute the labor of the miner would be transferred from a sphere where little more than patience and strength are required, to one in which judgement and skill would be involved—to the stopes and tribute pitches, the extent of which would be augmented tenfold, or to what would, under the new system of mining, assume a more important relative position, that of ore-dressing, which, it is well known, admits of immense improvement, and which improvement would be necessitated by the greatly increased returns under the altered circumstances.

Let us for a moment compare the two agencies, not so much as to their results, but as to their relative efficiency, *per se*. With his hammer and nuger the miner may now administer, upon an average, eight blows per minute. How many of these blows are effective? How many fall powerless upon the boring instrument? Is it not obvious that they must diminish in force with the exhaustion of the manipulator? How many times must he rest to recruit his strength during the few hours of occupation? How often must he retire during the blasting operation? These and numerous other queries suggest themselves. But how different are the conditions with a machine driven by steam power. Every blow is true, every blow is effective. The rapidity with which the blows are administered increase their efficiency. Meanwhile the same process is going on over the whole surface, the boring instrument can be driven deeper into the recesses of the rock, one blasting at the removal of the machine will suffice to strip the whole face of the forebreast. The replacement of the machine will assist to clear the level of the foul atmosphere arising from the explosion, and the work will be carried forward with an impetus so unwonted that mining will no longer be counted among the laggards of civilization.

By the existing system the courage and faith which are demanded of the adventurer makes one often wonder that he does not eschew mining altogether. Nothing but the brilliancy of the prizes, at rare intervals, could sustain his fainting hopes. In certain districts for example it is well known that no success can be reasonably anticipated within eighty or one hundred fathoms from the surface, and the adventurer often embarks in an enterprise involving years of time and a large outlay of capital, it may be of the highest promise, but nevertheless, presenting the most absolute uncertainty of success.

Or where death has not to be encountered, long drives either in the shape of cross-cuts or on the course of the lode are necessarily attended by the same penalties of time and expenditure. In either case, by the adoption of steam-boring machinery time would be abridged and outlay economized in a ratio which would reduce mining almost to the condition of commerce or manufactures. We could, if the fact were notorious, point out innumerable cases where the courses of ore known to exist could not be worked for want of ventilation, a matter easily remediable by the introduction of steam machinery; and other instances where whole districts have lain idle for years, during the tardy process of bringing up an adit, the only thing that hindered the vigorous application of capital for the development of the well-

known mineral resources of the neighborhood. Such works could be reduced by machinery to a question of months instead of years, and to an outlay of hundreds instead of thousands of pounds.

But our readers travel faster than we do in anticipating the results which may fairly be looked for from the introduction of machinery in place of the rude hand labor now employed. It is demanded by the diminished and diminishing productiveness of the copper and tin mines of Cornwall and Devonshire. It is demanded as necessary to bring up this ancient and honorable industry of the west of England to a level with the other great industries of the country. It is

The accompanying cut represents a new and meritorious washing machine, invented by Wm. R. Richardson, Esq., of this city, styled "Richardson's Californian." The patentee claims that it is the only machine in the world that will wash the streaks out of collars and wrists.

It is simple in construction, works easy and washes without wearing the goods. The wringer is covered with India rubber, and is set with screws, so as to wring as desired without wear or tear.

DESCRIPTION.—The box is four feet six inches in length, one foot six inches wide, and fifteen inches in height. The cylinder (grooved) is fourteen inches in diameter, and sixteen inches in length, with a concave on the top of the cylinder, with rollers hinged so as to turn up.

The goods are fastened to a wheel by a line, revolve with said wheel, run through the suds, and are squeezed between the wheel and concave rollers. At the end of the wheel is an eccentric, which drives the piston to the end of the box, where there are two chambers for goods, and the follower or plunger works both ways, so as to squeeze as a fulling machine does.

The inventor has secured his right by caveat, and during the past week has had his papers prepared by us for procuring a patent, which will undoubtedly be issued without delay.

We deem the invention a meritorious one; have seen it in operation and vouch for its being everything claimed.

SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San Francisco.

It is generally much better to apply for foreign patents simultaneously with the application here; or if this cannot be conveniently done, as little time as possible should be lost after the patent is issued, as the laws in some foreign countries allow patents to any one who first make the application,

imperatively demanded by the miner, whose premature exhaustion and early grave are the inevitable result of the present cruel system. Capital demands and is entitled to in this present nineteenth century, a better and more certain reward. Science, which is ruling the elements of nature everywhere, demands that this department be no longer excluded from her dominion, a department which she is as capable of subordinating as any of those wherein she now reigns with a sway which admits of no opposition, and where her operations demand and receive universal admiration.—*London Mining Journal*.

and in this way many inventors are deprived of valid patents for their own inventions. Many valuable inventions are yearly introduced into Europe from the United States, by parties ever on the alert to pick up whatever they can lay their hands on, which may seem useful.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to enuse such examination to be made before he will accept the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Address, J. SILVERSMITH,
SAN FRANCISCO.

N. B.—R.W. FENWICK, Esq., recently of the *Scientific American*, and for over fourteen years a successful patent solicitor in Washington, D. C., is associated with and will hereafter transact all business pertaining to patents for us, at the patent office in Washington city. For instructions and the new law regulating patents, we refer the inventor to the above.

Miners, Inventors, Agriculturalists, Capitalist and Mechanics, will find it to their advantage to subscribe for the MINING AND SCIENTIFIC PRESS—being the only journal of that class published upon this continent. Issued every Saturday at four dollars per annum.

BOUND VOLUMES of the above journal can be had on application, also any back numbers.

Mining Companies and Associations

Office of the Bullion Gold and Silver Mining Company, 410 Montgomery street, San Francisco, Jan. 13, 1862.—Notice is hereby given that at a meeting of the Board of Directors, held on the 11th inst., an assessment of ten cents per share was levied on the capital stock of this company, one half of which is called forthwith.

By order of said Board.

C. S. HIGGINS, Sec'y.

Office Cedar Hill Tunnel Mining company, No. 609 Sacramento street. An assessment of Two hundred and fifty dollars per (original) share has been levied by the Trustees, payable as follows: Twenty per cent. on the 15th of January, and twenty per cent. on the first of each month following until paid in full.

CHAS. L. FARRINGTON, Sec'y.

Office of the Falls of Clyde Consolidation Gold and Silver Mining Company, New No. 634 Washington street, San Francisco, January 3d, 1862.—At a meeting of the Board of Trustees of the Falls of Clyde Consolidation Gold and Silver Mining Company, held January 3d, 1862, an assessment of one eighth of one per cent. on the capital stock of the company—being twelve and one half cents per share—was levied, payable within thirty days from this date, at the office of the company in this city.

W. L. DUNCAN Sec'y.

SHAREHOLDERS of the Osceola Gold and Silver Mining company are hereby notified that the meeting of the Trustees of said company in Virginia city, on the 2nd inst., an assessment of twenty cents a share was levied on the capital stock of said company, payable on or before the 20th instant to the Treasurer, at his office in Gold Hill, or to D. H. Russell, Virginia city. Shareholders failing to pay the assessment at the time required, are hereby notified that so much of their interest in said company as will be sufficient to pay the amount of their delinquencies will be sold at public auction, in front of the saloon of Ludington & Russell, in Virginia city, on Saturday, the 10th day of December next, between the hours of twelve and three P. M.

J. S. WATKINS, Treasurer, Osceola G. & S. M. Co.

Office Ophir Silver Mining Company, San Francisco, Nov. 20th, 1861.—The Annual meeting of the stockholders of this company will be held at their office in San Francisco, on Wednesday, December 11, 1861, at 11 o'clock, A. M., for the election of officers for the ensuing year, and transactions of such other business as may be presented.

JAS. W. WHITE, Sec'y

ADRIATIC CO.

POSTPONEMENT OF SALE.—Delinquent stockholders are hereby notified that the sale of delinquent stock advertised to be sold on November 10th, has been postponed until Thursday the 21st inst., at which time all delinquent stock will positively be sold in front of the Secretary's office, at 1 P. M.

By order of the Board of Trustees.

JOHN G. GILCHRIST, Sec'y.

A MEETING of the shareholders of the Summit company will be held at the Gold Hill Bakery, in Gold Hill, on Friday, Nov. 15th, at 7 o'clock P. M. Punctual attendance of the shareholders is requested, as business of importance will be transacted. By order of the President.

JOHN DOHLE.

SAVAGE Gold and Silver Mining company. A meeting of the stockholders in the above company will be held at 10 o'clock, A. M., the 17th day of December 1861, at the office of Lent, Sherwood & Co., in this city, for the transaction of important business. Parties claiming an interest in the above company will please send in an abstract of their title either to Robert Morrow at Virginia city, to A. K. Head Nevada; or the undersigned before the 14th day of December next.

W. M. LENT, President.

San Francisco, November 27, 1861.

Office Bullion Gold and Silver Mining company, Van Horn District, 305 Montgomery street, San Francisco. Notice is hereby given that the regular annual meeting for the election of officers for the ensuing year will be held at the company's office on the first Monday in December next, at 2 o'clock P. M.

T. L. BURNES, Sec'y.

NOTICE.—There will be a meeting of the Sides Gold and Silver Mining company, on Sunday, November 17th, 1861, at 11 o'clock A. M., at the house of M. H. Bryan, Virginia City.

A punctual attendance is requested, as business of importance will come before the meeting.

M. H. BRYAN, Sec'y.

GOLD HILL TUNNEL CO.—The meeting called for Saturday, November 10th, is postponed till Thursday, November 14th, 1861. The meeting will be held at the saloon of Webb & Coppers, Gold Hill.

A punctual attendance is requested, as business of importance will come before the meeting.

ROBERT APPLE, Sec'y.

SHAREHOLDERS of the Calistonia Gold and Silver Mining Company are hereby notified that a meeting of the Trustees in Gold Hill, on the 4th inst., an assessment of twelve and one half cents per share was levied on the capital stock of said company, payable on or before the 20th inst., to the Superintendent, at his office in Gold Hill, or to W. B. AGARD, San Francisco. Shareholders failing to pay said assessment at the time required are hereby notified that so much of their respective interests in said company as will be sufficient to pay their several delinquencies, will be sold at public auction in front of the office of Wells, Fargo and company at Gold Hill, on the 9th day of December next.

By order of the Board of Trustees,

Gold Hill, Nov. 4th, 1861.

POSTPONEMENT OF SALE.—The sale of mining ground, at Silver City, by the Kinnas Mining company, is postponed until four o'clock, P. M., Tuesday, Nov. 19th, 1861. Sale to take place on the grounds of the company. Delinquents will please take notice and come to time.

By order of the Board of Trustees.

R. C. CHAPPELL, Sec'y

Office Chollar Silver Mining Company, 112 Front street, San Francisco, Nov. 20th, 1861.—The annual meeting of the Stockholders of this Company will be held at their office in this city, WEDNESDAY, December 4th, 1861, at 11 o'clock A. M.

W. E. DEAN, Sec'y Chollar S. M. Co.

Office of the Succor Gold and Silver Mining Company, Nos. 1 and 2, Montgomery Block, San Francisco, California.—Notice is hereby given that the annual meeting of the Stockholders of the Succor Gold and Silver Mining Co., will be held at the office of the Company, Nos. 1 and 2 Montgomery Block, on the first Monday after the first Tuesday of January, A. D. 1862, at ten o'clock A. M., of that day, for the election of Trustees, and for the transaction of other business.

By order of the Trustees.

R. H. WALLER, Secretary.

NOTICE is hereby given to the members of the Arizona company, that there will be a meeting of said company held at the Recorder's office, in Virginia city, N. T., on Saturday the 23d inst., for the purpose of organizing said company. All delinquents are notified that unless their assessments are paid by said date, their interest in said company's claims will be sold to pay the same.

R. T. SMITH, President Arizona Company.

Office of the Desert Mining company, 509 Montgomery street, San Francisco, Nov. 23d, 1861.—The stockholders are hereby notified that an assessment of one dollar per share on the capital stock of the Desert Mining company, has this day been levied, payable on or before the 23th day of Dec. next, at the office as above.

By order of the Board of Trustees.

J. H. LYON, Sec'y.

NOTICE.—The regular annual meeting of the stockholders of the Cedar Hill Tunnel and Mining Company, will be held at the office of the Secretary, on Thursday, January 2d, 1862, at 7 o'clock P. M., for the election of officers for the ensuing year, and such other business as may come before the meeting.

San Francisco, December 2d, 1861.

C. L. FARRINGTON, Sec'y.

Office of the (Russ District) Union Gold and Silver Mining company, San Francisco, Dec. 13th, 1861.—The stockholders are hereby notified that an assessment of ten cents per share on the capital stock of the Union Gold and Silver Mining company was levied on the 12th inst., payable on or before the 15th of January, 1862, at the office of the company, 410 Montgomery street.

By order of the Board.

C. J. HIGGINS, Sec'y.

NOTICE is hereby given that an assessment of One Dollar per foot (share) has this day been levied on the ground of the Alhambra Mining company, payable at the office of the company, 315 Sansome street, San Francisco.

By order of the Trustees.

J. O. STRAUCH, Secretary.]

NOVEMBER 24TH, 1861.

GOLDEN GATE COMPANY, GOLD HILL DISTRICT.—A meeting of the shareholders in the above named company will be held at the office of H. O. Gaylord, in Virginia on Saturday, Nov. 16th, at 7 P. M.

By order.

T. A. MONKHOUSE, Sec'y.

MEMBERS of the Senator company, Congress Ledge, Devil's Gate District, are hereby notified that an assessment of twenty-five cents per foot was this day levied by the Board of Directors, payable to the Secretary at his office, in Virginia, on or before the 15th day of November, instant.

L. W. FERRIS, Sec'y.

Office of the Cole Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Cole Silver Mining company held Oct. 25th, 1861, an assessment was levied of one-tenth of one per cent. on the capital stock of the company, being fifty cents per share, payable within thirty-five days to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.

By order of the Board of Trustees.

J. B. COFFIN, Sec'y.

Office Dios Padre Gold and Silver Mining Company, 215 Front street San Francisco, October 29th, 1861.—A meeting of the stockholders of the Dios Padre Gold and Silver Mining company, be held at the office of the company, on Saturday, November 16th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting. By order of the Board of Trustees.

JOS. P. NOURSE, Secretary.

Office Rogers' Silver Mining Company, San Francisco, October 15th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 15th day of November, 1861, at the office of the company, in this city.

By order of the Board of Trustees.

JOEL F. LIGHTNER, Secretary.

Office Gould & Curry Silver Mining Company.—November 6th, 1861. Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the sixth day of December next.

JAS. C. L. WADSWORTH, Secretary.

Office of the Gold and Silver Mining Company, San Francisco, October 19th, 1861.—Notice is hereby given, that at a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one half of which will be made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.

C. S. HIGGINS, Secretary.

Office of Succor Gold and Silver Mining company.—Notice is hereby given that the Board of Trustees of this company (formerly the Succor company, Gold Hill District.) have this day, Tuesday, Nov. 19, 1861, duly levied an assessment of fifty cents upon each share or foot of the capital stock, of or ownership in, said company, payable immediately to the Secretary, at their office, Nos. 1 and 2 Montgomery Block, San Francisco, or to J. A. Hobart, Trustee at Gold Hill, Nevada Territory. On default of payment of which assessment for thirty days after publication of this notice, all delinquent stock and ownership will be sold according to law, and the rules and By-laws of the company.

R. H. WALLER, Sec'y.

NOTICE.—Notice is hereby given, that Jos. J. DuPrat is the only authorized agent in California, U. S. of America, for the silver mines known as "Mina Rica," "Guasaba," "Fortuna," "Santa Cruz," and "Nacimiento," situated near San Antonio, Lower California, Mexico.

CHAS. J. DUPRAT,

EM. LEYA,

DEPRAT, SCHMITZ & CO.,

CHAS. KRAFT & CO.,

La Paz, Lower California, July 30th, 1861.

RATES OF OCEAN PASSAGE.—The prices of passage on the steamers of the P. M. S. S. Co., through to New York, are as follows: First cabin, deck room \$253 50, main deck room, \$233 25; second cabin \$180 75; and steerage, \$128 25. To go to New York around Cape Horn in a clipper ship, first cabin, costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage to China costs from seventy-five to one hundred and twenty-five dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage to England costs about \$150.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 2d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above pursuits, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers! This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum. Club Rates. Five Copies for Six Months, \$8. Ten Copies for Six Months, \$16. Ten Copies for Twelve Months, \$30. Fifteen Copies for Twelve Months, \$44. Twenty Copies for Twelve Months, \$56. For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Room 24, (formerly) U. S. Court Building, Corner of Washington & Battery streets, San Francisco.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....JAN. 25, 1862.

The MINING AND SCIENTIFIC PRESS published at 522 Merchant bet. Montgomery and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will hear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

REMOVAL OF THE "PRESS" AND PATENT AGENCY.

The business of this office having become quite extensive, it therefore made it incumbent upon us to remove from our offices in the Government House, where we had scarcely room enough to do our regular office business. We occupied said premises for nearly two years, and were really loth to leave them. Circumstances have placed us so that we now can enjoy separate offices for the printing of our MINING AND SCIENTIFIC PRESS; and the applicants for letters patent need no longer be interrupted by the thousand and one inquiries heretofore made, while we occupied said offices.

We have moved our printing rooms to Merchant street, No. 522, between Sansome and Montgomery up stairs, and the

PACIFIC PATENT AGENCY

and the Editorial rooms are now eligibly situated in the former U. S. Court Building, northeast corner of Battery and Washington streets, in room 24. All persons having business with us will favor us with a visit as early as convenient. Letters will be addressed to us in accordance with the above.

Railroad from Placerville to Tide Water.

The project of connecting Placerville with Tide Water by railroad, has of late been considerably agitated by the Placerville and other interior papers, and we have been pleased to learn that some of the substantial men of the former place are interesting themselves in the matter.

The line indicated as preferable is the one starting at Placerville, thence down the Consumnes river, striking Tide Water somewhere near the confluence of the Sacramento and San Joaquin rivers. The distance has been stated at forty-eight miles, this, however, we deem a mistake; the

distance must be somewhat greater than this, yet we think will not exceed it by more than ten or fifteen miles. The route is undoubtedly a feasible one, and considering the rich agricultural country it would pass through, its near approach to vast tracts of the very best timber land in the State, the coal mines of Ione and Buckeye valleys, the rich quartz mines of Sutter and Amador, the marble quarries of Volcano, besides the immense amount of freight, which would, as a matter of course, be transported from the metropolis of the State to the agricultural country it passes through, the whole of Amador and a greater portion of Calaveras county; The whole of El Dorado county, to say nothing of the enormous quantity required by Nevada Territory, including machinery vast in amount, all of which, as a matter of economy, and deduction in cost, would for a certainty be shipped over this road. We can come to no other conclusion than that such a road over that route, if ever built would indeed be the most profitable railroad ever constructed in any State in the Union.

We do not believe, however, nor ever did, that the route or pass now traveled from Placerville to Nevada Territory is the most feasible one for a railroad, knowing from personal observation that the ascent is two abrupt in many places, besides leading over too disconnected summits, while several other routes have but one summit, and less obstacles in other respects. Yet, being convinced that owing to the existing state of things in the East, the unsettled condition of our common country, and the exhausted state of the national treasury, we can in no wise expect any aid from general Government in the commencement and construction of a Pacific railroad perhaps for years to come, and without such aid we consider the building of a road across the mountains, at any point, a forlorn hope. We say, convinced of these facts as we are, and as every candid mind will become if the subject is seriously considered, we deem the route for a railroad across the Sierra Nevada has nothing whatever to do with the matter of building the road from Placerville west.

This road will be amply able to take care of itself, without being ever made the starting point of the Pacific and Atlantic Railroad; and for this very reason we are convinced that the project would be a profitable undertaking, without depending on any connections by branch or other roads; we urge the building thereof, and do sincerely hope the project will not be abandoned, and that the parties who have interested themselves in the matter will not allow their interest in the matter to flag.

These remarks are based on the supposition that the route in the commencement of this article mentioned, as the one under contemplation, will be adopted.

Whether a branch road from Placerville, connecting with the Sacramento valley road at Folsom would be equally practicable, and offer equal inducements for the investment of capital, we would not wish to hazard an opinion upon. The route via Consumnes river in our humble judgement is the most practicable, and it would also command the entire trade of Amador county, and a portion of Calaveras, which surely is no small consideration.

As we look at the matter this is the route that should be adopted.

Our Patent Agency.

The past week has again been prolific in bringing to light the offspring of the inventive genius of the people of this State, in the shape of a half dozen new and useful inventions, the papers for securing Letters Patent for which were perfected at our office. Foremost in merit we class the invention of Carl Schumacher—an improvement in breech loading firearms, an engraving of which will be seen on the first page.

Mr. Richardson applies for Letters Patent for an excellent washing machine; Mr. Leeler for a quartz crusher and amalgamator; Dr. Steinberg for improvements on artificial gum enamel plates; Mr. Delange for a shell design for ornamenting graves. Indeed, hardly a day passes but we are called on to perfect papers of this sort.

En-passant, we would remark that our facilities in this profession are not excelled anywhere. Inventors should bear this in mind, and be certain to call on us whenever they have patent papers to perfect, or wish information in regard to matters pertaining to new inventions, &c.

Legislative.

Pursuant to adjournment the Legislature convened at Sacramento, on Tuesday the 21st. The question of a removal to San Francisco was at once brought before the House, and after much maneuvering and considerable ill feeling displayed on both sides, finally passed the Assembly on Wednesday, which action was immediately concurred in by the Senate. So the 13th annual Legislature of California will, during the remainder of its term transact business in this city.

The necessity for this action is to be regretted; nevertheless owing to the present condition of Sacramento city, it would in our estimation have been unwise to remain there longer, squandering money without proper facilities for doing the work before them.

We trust the members will now set themselves to work immediately and with earnestness finish up business in the shortest possible time, and adjourn sine die.

Such policy in view of the great calamity which has befallen the State—the sad depletion of the treasury, and for other obvious reasons, should suggest itself to every member as proper and right. This is no time for indulging in trivial legislation, which, however, we doubt not is as apparent to members as to ourselves.

County Investments in Railroads.

We have ever been averse to projects, taxing people of a county for the purpose of building internal improvements. It is bad policy, and as numerous instances will attest, never results in the good sought to be derived therefrom. A case in point is the action of the people of Solano county, who, in 1859 by a vote of 796 to 661, accepted the proposition to take \$200,000 of the capital stock of the San Francisco and Marysville Railroad company.

It appears that nearly the one-half of said amount has already been expended, or at least bonds for that amount have been put in circulation, the interest upon which is \$7,000 per annum, while the work seems to be scarcely any further advanced towards completion than when the scheme was first broached. The only headway made being the grading of twenty-eight miles, which improvement is now in a fair way of being sold for taxes.

It is true that communities are as a general thing benefitted by public works of this kind passing by their vicinity, but whenever their necessity is apparent, and the profitability of the same established, private enterprise and capital will, in most instances supply the deficiency.

The result of the Solano County speculation amounts to this, the people pay taxes at the rate of two dollars thirty cents on each one hundred dollars, a considerable portion of which is required to pay interest on the bonds issued, and another portion to liquidate a certain amount of the bonds themselves. The latter when issued and sold, realized about fifty-three cents on the dollar, while quite recently the county redeemed \$7500 of those same obligations at eighty-four and a half cents on the dollar—not a very cheering picture for the tax payers of that county, as we view it; it is buying experience at a dear rate, but may serve as a useful lesson, and deter other counties from acting in the same unwise manner.

An Important New Invention.

We call attention to the engraving found on our first page, of a new invention perfected by Carl Schumacher, Esq., of Arcata, Humboldt county, California.

In our humble judgement it is the most perfect breech-loading firearm ever invented, and which will sooner or later supersede all other "breech loaders" now in existence. We are always ready and pleased to accord to true merit its just need of praise, but feel that in this instance, anything we can say of this beautiful and perfect production would be but faint praise indeed.

Mr. Schumacher is a Teuton, possessing a clear brain and mechanical ability, nevertheless he assures us that his mind has been to work on this improvement for the long space of fourteen years; at last, however, his efforts have been crowned with success. The completion of this one undertaking and a securement thereof by patent, will place this humble man above want for all time to come.

In this instance we are quite certain merit will not go unrewarded. For a full description see first page.

Medical Press.

This excellent quarterly—the January number has been laid upon our table during the past week.

This valuable publication is now entering upon its third volume. It is a neatly printed pamphlet containing about twenty pages of excellent matter, made up of editorials, original contributions, reviews and notices pertaining to medical subjects, all of them highly interesting to every medical student at least, if not indeed to every searcher after useful knowledge. All subjects in the present number are ably handled, which fact, however, is not surprising, considering the many proficient medical men we have in our midst.

We sincerely trust the efforts made by the illustrious editor and publisher of this work will not go unrewarded. Every medical man on the Pacific Coast should at once become a subscriber, as well as contributor, whenever anything comes under his personal notice, the publication of which would be aiding in the development of medical science.

The work is edited by E. S. Cooper, A. M., M. D., professor of anatomy and surgery in the medical department of the university of the Pacific.

The subscription price is two dollars per annum, payable in advance.

Arizona.

The second class contains the same minerals as the first, but they are more intimately associated with the gangue, which in this class forms the bulk of the ore. The blende and galena have a moderate percentage of silver, (thirty to fifty ounces) while the tetrahedrite (Fahlerz, or Gray Copper ore) varies from one to one and a half per cent., and the Stromeyerite is said to rise as high as twenty-six per cent. Chlorobromide of silver and native copper have occurred, and native silver in small flakes is frequent. Two varieties of quartz are found, one in the ordinary glassy form, often combed; and an opaque white variety, very brittle and associated with the richer minerals.

Crystallized specimens are very rare, and of the copper-silver-glance none have been observed.

I have observed the following well defined paragenetic successions occurring in cavities:

- 1 quartz; 2 brown spar; 3 scalenohedral calcite.
- 1 brown spar; 2 barytes; 3 scalenohedral calcite.
- 1 quartz; 2 glenn; 1 quartz.
- 1 quartz; 2 blende; 3 calcite.
- 1 quartz; 2 blende; 3 rhombohedral calcite; 4 native silver; 5 scalenohedral calcite.
- 1 quartz; 2 brown spar; 4 barytes; 4 native silver.

From this it will appear that the general succession in age is: 1st. quartz; 2d. brown spar; 3d. blende, barytes; 4th. calcite; 5th. native silver; 6th. scalenohedral calcite. From this list of the relative ages of blende and barytes do not appear.

Glenn, blende and tetrahedrite are usually closely associated with each other in this ore, while the argentiferous sulphuret of copper is entirely independent of them, but is, at times, mixed with erubescite.

Native silver occurs in the common filigree form in cavities in the argentiferous copper-glance, and is often observable in minute specks on the tarnished surface of blende and tetrahedrite.

The reduction works are on the Arivaca ranch, eight miles distant from the mine, and connected with it by an excellent road. The process used is the European barrel-amalgamation for argentiferous copper ores, and was introduced by Mr. Kustel, a German Metallurgist, three years since. The extent of the works is very small, permitting of the treatment of about one and a half tons per day. Six dry stamps, a steam arastra, one reverberatory roasting furnace, four barrels, a retort and one refining furnace, together with a ten horse power engine, constitute the works.

The second class ore, after being coarse stamped, is removed to the arastra, which is capable of grinding one ton per day to the necessary fineness. The resulting slime, after drying, is pounded and sifted. Five hundred pounds of the ore, after being mixed with from eight to ten per cent. of salt, are subjected to the chloridizing roasting for about four hours. About one-half hour before withdrawing the charge, two per cent. of unburnt limestone is added to reduce the bichloride of copper to protochloride. In this manner, six roastings are made in twenty-four hours.

The barrels are charged with 1,000 pounds of the roasted ore; 100 pounds metallic copper in metallic balls, and fourteen pounds of water. After revolving two hours, to effect the partial reduction of salts injurious to the mercury, by the copper, five hundred pounds of quicksilver are added.

After revolving twenty-four hours in all, including the second watering to collect the disseminated globules of quicksilver, the whole is withdrawn and the amalgam separated and retorted. The resulting silver is simply melted in a small reverberatory refining furnace, with the addition of a little borax, and cast in bars of different sizes, having a fineness of 0.990 to 0.998. In the absence of coin, these are used as a circulating medium, and find their way to Sonora and, ultimately, to England.

CALIFORNIA.

Nevada County.—The following is copied from the San Juan Press. A mining region is judged by certain external and general indications. These are a gravelly soil, usually of a red color, containing quartz pebbles or howlers. The skillful miner would never think of putting down a shaft, running a tunnel, or washing a panful of earth, where these signs did not exist; and when they do exist, he commences operations almost with the certainty of success. The gold is sure to be found in the gravel; it may be in at various undetermined depths.

We are located in the midst of such a country. On the right and left, the east, west, north and south, these gravel ranges are found. Spots in some of them have been opened and profitably worked; but by far the greatest extent of country yet remains to be prospected. A succession of gravelly ranges, or ridges occur between the middle and South Yuba, judged to be rich in gold, and the Columbia hill via Orisko to the Middle Yuba. But few miners have had either the courage or the capital to pierce into the bowels of the immense hills which intervene. A few have commenced tunnels, which have been irregularly and slowly worked, and are confident, from the nature of the different strata encountered—most of which prospect well—that they have only to discover where the bed lies and follow its dip to meet with a full realization of their hopes. The ravines have all paid toll, and the face spots on the hill sides, hill-tops, and in the dry canons have been washed—in some instances yielding almost fabulous returns. This fact inspires a belief that the interior of the hills must be abundantly rich in the precious metals.

A tunnel has been opened on Grizzly Ridge, north side of Grizzly Canyon, by Mr. Mowitt, of this place, and several other gentlemen, which has been run in about three hundred feet. The earth is so hard as to require no timbering up. On the face of their claim five or six different streaks or strata of earth, of a fine gray or grayish color, are discernible. They vary in width from six to ten, fifteen and thirty inches. In several of these strata gold is found coarse; and if water were conveyed it could not doubt be worked profitably. The parties are of the opinion that they have commenced operations too high on the hill, and it is their intention to commence a new tunnel lower down. Some time therefore must elapse, before a satisfactory solution can be given to the mystery, which they are endeavoring to probe.

Want of capital is the great drawback in the undertaking of stupendous enterprises. Few men who have the courage and the energy, have the means of penetrating into these ponderous mountains. The element is hard, and yields with the greatest reluctance to the slow and tedious blows of the pick. For this reason, years may pass before the auriferous wealth of this region is fully developed; but that it exists, is a matter as fully established as any probability well can be; and there are those now living who will share in the era of prosperity which the opening up of the country will at some future day undoubtedly inaugurate.

OREGON AND WASHINGTON TERRITORY.

In a late number of the Portland Daily Advertiser we find the following, being editorial giving a description of that part of Oregon and Washington Territory said to be rich in mineral:

The gold field extends without cessation, from the northern frontiers to within a few miles of the Utah line, or all that space included between the forty-second and forty-ninth degree of latitude, and from east to west all that section of land lying between the 121st and 119th degree of longitude. Here then is an empire in itself, before which California's sun will pale, and Columbia's star must go down in obscurity. Bordering upon British Columbia, and southward from the famous Cariboo mines, are the Kootenay, Okanagan and Blackfoot nations. That the Kootenay will one day vie with Washoe for the palm in silver we believe. In 1850, specimens of silver ore, found in that country were exhibited at the Dalles. The ore was equal to any taken from Washoe. Nothing was done however to explore the country, although public attention was called to the fact, through the columns of the Dalles Journal.

Okanagan is rich in alluvial deposits, but of the Blackfoot region nothing is known. To the south and west of those nations are the Colville, Spokane, Coeur d'Alene and lower Pend d'Oreille tribes, whose country has been partially prospected and found to be immensely rich. The Colville country too has for several years, been a favorite camping ground for the miner, and we hazard the saying that men have taken out fortunes in that locality, even now miners in that vicinity are making money at the rate of two dollars a day to the haul. The lower Pend d'Oreille and Spokane Indians have always opposed any invasion of their country by the whites. Yet at and near the mouth of Spokane river, Judge Yancey, of Bellingham Bay, and some 20 miners, have been at work for six months, and we are informed making from ten to fifty dollars a day to the haul. As we descend, we enter the upper Pend d'Oreilles, Flathead or Bitter Root, and the Nez Percés country. On the upper Pend d'Oreilles men are making as well as at the Nez Percés. Miners do as high as one hundred and twenty dollars a day with a rocker, and Mr. Stephen Senter, an old miner, now at Salmon, took out as high as two hundred dollars a day, and worked there until ordered away by the Indians.

Of the Bitter Root region we only know, that at Fort Owens, and on the branches of Clark's Fork of the Columbia river, gold has been discovered as far back as '53. Lieut. Doniphan's command, in that year, and many years ago, Major Owens found gold on the little Prickly, Pear creek, also in the Blackfoot river. This section may be said not to have been prospected, although little doubt exists in the minds of those to whom the country is known, of its great richness.

Of the Nez Percés we will say nothing—everybody is familiar with them, from Elk City to Oro Fino, a distance of nearly one hundred miles. As we proceed southward we enter the Snake and Snake river country, the Snake and all its tributaries flow. Fifty miles south of Clearwater, and running parallel, is Salmon river. From its junction with Mormon river to its mouth, a distance of seventy-five miles, it flows northwest, till it empties into Snake river, about forty-five miles south of Lewiston. The present Salmon river diggings are on a low chain of the Bitter Root mountains, some twenty miles north of Salmon river. To the south of Salmon river and east of Snake river, is forbidden ground. All the branches and tributaries of both Snake and Salmon in that region, remains untrodden by the foot of the adventurous miner. Seventy miles to the south of Salmon river are the Salmon mountains, where rises the chief branches or forks of Salmon river, such as Mormon, Pashamara and other streams, flowing north and west into Salmon and Snake rivers. In that direction we anticipate important discoveries next summer. On the west of Snake river and on the eastern flank of the Blue Mountains, are the newly discovered mines of the Powder, Burnt and Malheur rivers. Forty miles southwest of the mouth of Salmon, and thirty miles southeast of Grand Ronde Valley is Powder river, having its source in the Blue Mountains. It is a small stream and runs northeast into Snake river.

Burnt, Malheur, Owyhee and other streams, having their rise in the Blue Mountains, flow in the same direction eastwards and northwards into Snake river. Payette, Boise, Rocher and other streams, flowing into Snake river, flow in an opposite course, southwards and westwards, into Snake river, all of which are supposed to be rich in the precious metal. Still further south are the Bannock, Shoshone, and Utah tribes or nations. Nothing is definitely known as to the auriferous character of that region.

At the base of the Bitter Root Mountains and east of the Salmon mountains, extends a range of magnificent grazing and farming land. To settlers the region offers equal to any on the coast. These settlements will not be more than one hundred miles from Fort Denton, and but a few miles from the head waters of the Yellow Stone and Missouri rivers. From Salmon diggings they will be but eighty miles, on the proposed route to Fort Laramie. We predict that one year hence all that section of country, now a barren waste, will resound with the labors of the husbandmen, and ere long the scream of the iron horse will follow. The traveler eastward bound will no longer have to break the heavy trail, but every day, but every day, at the roadside inn. That emigration will come westward, by Fort Denton, the coming spring, there can be no question. The magic influence of the new mines, upon the destiny of Oregon and Washington Territory, can hardly be appreciated, that they are destined to elevate these countries to the proud position of first class states, we confidently believe.

At some future day we will have a word to say of the rival routes and roads to these new mines.

NEVADA TERRITORY.

Ophir City.

The Silver Age remarks that the village of the above name is located only a few hundred yards beyond the Ophir Works. It has been built within the last six months, and has two stores, three saloons, one butcher's shop, one hotel and several private residences, with a prospect of considerable growth hereafter.

The addition to the Ophir Works is now about completed, and is fully as large as the original structure. This mill employs not less than seventy-five hands, and pays out about forty dollars monthly to them. Not less than one thousand pounds of gold and silver in bricks, is shipped from these mills per week, which is worth thirty-two dollars per pound if refined by the Smith process; with other processes it is not worth quite so much. When the new addition is fairly in running order, it is evident that this mill will wonderfully increase the weekly shipments of bullion.

Capt. Cheever, of Ophir town, is now at San Francisco making arrangements to push his railroad forward to completion at an early day. It will strike out east from the town and cross the north end of Washoe Lake on spurs, from whence it will run up Spring Canon to the summit overlooking Cold Hill; from this point it will circle around the hill to the Ophir Company's mines in Virginia city. This road is mainly designed to deliver silver ore at the mills, but will also accommodate way-freight, lumber and passengers. It will be the means of inducing other quartz owners to build mills in the vicinity of the Ophir Company's Works; and if we mistake not, the prospect for Washoe valley to become the site of numerous towns encircling hundreds of such establishments as these works, and making the west side of Washoe valley look like one vast city. This of course may only be a fancy of ours, but the future prospects of that section are far ahead of anything which has yet been written about it. Judge Watson, has just finished a large saw mill in the vicinity of Ophir, and it is understood that several others will be built higher up the mountain in the spring.

This ancient capital of the Utah Colony, has not improved much in the past year. A few houses have been built, and excellent ranches have been fenced in, but the town has not kept pace with others in the territory; yet its time has not fairly come, and another year will make a vast difference in its population and appearance. Messrs. John Dall & Co. have just completed a fine large quartz mill back of the town, which will be running in a few weeks. Lytle, Gallaher & Co., are now building a quartz mill up Franktown creek, which run twenty stamps and crush rock from the company's claims or that which they will buy, and will be worked on a new silver process introduced by Mr. Sees. With these improvements, and a full heading, Franktown will grow with great rapidity, as it has more good garden and ranch land about it than any other town perhaps, in the territory.

Rock has recently been taken from the Olney claim, Cold Hill, which was literally covered with fine gold. The company have contracted several tons of their rock, \$200 per ton.

During the last week or so numerous things in general have been looking up, and promising better than ever. Our mines are giving out their precious ores in a manner that pleases the owners thereof immensely. The St. Louis lode has proved itself rich one hundred tons of rock from that lode was crushed by Johnson & Co., at the Union mill, and realized, after crushing and hauling expenses, thirty-five dollars per ton. The yield would have been greater, but three sacks of very rich rock were kept back to be crushed by hand. I handled some of the rock named, and certainly never saw richer, even in the Allouez of Grand Valley.

Green & Co., of the Pioneer Mill, have been crushing some rock of the Aina lode, the yield of which I am assured was something pretty nice—although I cannot at present state the figure.

Mr. Flemming of Taylor & Co.'s Mill, informed me yesterday that they had been crushing boulders from Silver Hill, and that the amount yielded was much beyond expectation, they having yielded forty dollars per ton. These boulders are the debris of the many leads that crop out on Silver Hill. I heard during the last three weeks, that three tons of rock from several lodes in this vicinity crushed, among which are the Utah, Empire, Antelope, Caribald and others. The average yield was thirty-five to forty dollars per ton; and this has been done by mills that save the gold only, they having no silver saving process. No mill to save silver is yet in operation here.

Peck & Clayton's Mill I understand is nearly ready. They will commence crushing the Real del Monte rock next week. They have a silver-saving process. I hear about that mill which is about ready, and will save silver. Brodie, Store & Heath's mill, on Pine creek, and the Napa Company's mill, will start early next week. When these mills get in full operation you will see some bars of silver in your city from this place, as well as gold bars—which last you probably have seen already.

The Pride of Utah lode has been struck by Mr. Potter richer than ever. Rock from that lode is being taken to the Union mill while I write. I have seen many specimens from that lode, and they certainly are very rich. This mill employs not less than seventy-five hands, and pays out about four thousand dollars monthly to them.

Mining Companies and Associations.

Notice to Quartz Miners.

The Union Gold and Silver Mining company having opened their mineral lodes in the Rio Grande to an extent satisfying them of the value of the same, and having contracted for the erection of a quartz mill near said lodes (not exceeding five miles distant) are now desirous to contract with responsible parties for mining and delivering at an early day, at the said mill, not less than one thousand tons of quartz rock. Proposals will be received until the fourteen day of February next. For further particulars enquire at the Office of the company, 410 Montgomery street, San Francisco.

C. S. HIGGINS, Sec'y.

North Potom Silver Mining Company.—Notice is hereby given, that the Trustees of the North Potom Silver Mining company, have, this sixth day of January, 1862, levied an assessment of one dollar per share upon each and every share of the capital stock of said company, payable on or before the fifteen day of February, 1862, to H. A. Eastman, at Virginia City, or the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees.

J. H. BREWER, Sec'y.

Office of the Combination Gold and Silver Mining Company, 410 Montgomery street, San Francisco, Jan. 13th, 1862.—Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th inst., an assessment of ten cents per share was levied on the capital stock of this company, one half of which, together with three cents per share (remainder of an eight cent per share assessment levied July 26, 1861) is called forth with.

By order of the Board.

C. S. HIGGINS, Sec'y.

St. Louis Gold and Silver Mining Company.—Notice is hereby given, that the Board of Trustees of the St. Louis Gold and Silver Mining Company have this ninth day of January, 1862, levied an assessment of three dollars upon each and every share of the capital stock of said company, payable on or before the 17th day of February, 1862, to the Secretary of the company, at No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees.

J. H. BREWER, Sec'y.

Office of the Mount Davidson Gold and Silver Mining Company, No. 402 Montgomery street, San Francisco, Dec. 27, 1861.—Notice is hereby given to the shareholders of the Mount Davidson Gold and Silver Mining Co., that an assessment of 25 cents has this day been levied on each share of the capital stock, the same payable on or before the fifth day of February next. In default of payment, all defaulting stock will be advertised and sold according to law.

M. T. BROCKLEMAN,
Secretary of Company.

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street, near the Gas Works, San Francisco. Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc. The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested in their new style of Portable Dry Crushing Batteries with wrought-iron framing.

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends they wish disinterred, are informed that they have the most complete registry in existence of graves in that cemetery, having added to my own records by purchase, the books of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on handsomely tinted paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3d. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—(Morning Call.)

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer: together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.]

A BOOK FOR THE MINER.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide," a compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer: together with a comprehensive glossary of technical phrases used in the work. It is a handsome volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its Character: and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.]

NEW AND VALUABLE MINING BOOK.—We have been presented with a mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press," of San Francisco. The title of the book is "The Miner's Companion and Guide," and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer: it contains also, the latest and most up-to-date process for separating gold, silver and pyrites. In the latter portion of the book, will be found a glossary of technical terms. The whole is neatly edited, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and doubt will meet with great sale.—[Sac. News.]

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout our mining towns for its merits and usefulness. We earnestly commend it to those who are practically interested in bringing to light from Mother Earth its hidden treasures.—[Union Temperance Journal.]

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the forty years of Mr. Hemphstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 10; being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,273 39. Under Mr. Hemphstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hemphstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hemphstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hemphstead's Superintendency. Under Mr. Stevens, the present Superintendent we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths. fine.....3cts per oz.
" from 300-1000ths. to 750-1000ths fine. 7cts " "
" 750-1000ths to 950-1000ths " .14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce 1/2 per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, 1/2 per ct. gross value of silver for making bars; also when gold is contained 1/2 per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. 1/2 per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. 1/2 per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. 1/2 per ct. gross value of deposit for making bars.

In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of 1/2 per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

TO FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our extensive establishment, we can confidently announce to the public that we now have

Best Foundry and Machine Shop on the Pacific Coast.

upwards of forty-five thousand dollars worth of patterns, we are enabled to work cheaper and quicker than any other establishment on the Pacific Coast.

able to order, and have for sale, High and Low Pressure Engines, and Stationary; Straight Quartz Mills of all sizes and Stamp-mills and those of iron, which is imported by us expressly for the purpose—its peculiar hardness making shoes and dies last two or three times longer than any other; Mining Pumps of all sizes and kinds; Flouring Mills; Gang, and Circular Saw Mills; Shingle Machines, cutting 25,000 per cent. more perfectly than any now in use. One of these shingle machines is now in operation at Metcalf's mill in this city.

Amalgamators, with the latest improvements; Howland & Hausman's amalgamator; Goddard's Tub, lately improved; in fact, all kinds now

Screens, of every degree of fineness, made of the best Russia Iron, and Axes of all dimensions; Building Fronts; Horse Powers; and Boilers Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Patent to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

boat work promptly attended to. We are, for the public for their many past favors, we would respectfully continue of their patronage. Before purchasing, give us a call that we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour tor arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and ye simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing. **KNAPP, BURRELL & CO.,**

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM DON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States

ap25 CHLESAR MASON

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000

IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties disposed to invest in the Stock of the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that Purpose, by resolution of the Board.

The Books of Subscription are open at the office of Piche & Bayarque where the required first instalment of 10 per cent. will be received.

F. L. A. PICHÉ, President.

J. H. APPELATE, Secretary.

BLAKE'S STONE BREAKER.

The machine shown by the annexed cut has been patented in the United States and in several foreign countries. It is designed to break stones into small fragments, to be used for road making, railroad ballasting, concrete, or other purposes, and to crush ores or minerals of any kind. The machine may be made of any size.

The above engraving is a perspective view of the machine entire, showing a cast iron frame set upon feet provided with holes for bolts, by which it may be fastened down if desired.

On one end and bearing on the frame, is a shaft with two large fly-wheels attached; between the hearings on the side of the frame, said shaft is formed into a short crank, and on the end of the shaft is placed a pulley to receive a belt from a steam engine or other driver.

To the short crank of the shaft is attached a Pitman or connecting rod, which connects said crank with a lever, upon which lever stands a vertical piece against the top of which two toggles have their bearings, forming an elbow or toggle joint. A fixed jaw at the opposite end from the shaft is the point against which the stones are crushed, which jaw is bedded in zinc against the end of the frame, and is held back to its place by cheeks that fit in recesses in the interior of the frame on each side. A movable jaw, the upper end of which is seen in the cut, is supported by a round bar of iron, passing freely through it, and which bar forms the pivot upon which the jaw vibrates. Behind said movable jaw is placed a spring of India Rubber, which is compressed by the forward movement of the jaw and aids its return.

Every revolution of the crank causes the lower end of the movable jaw to advance towards the fixed jaw about a quarter of an inch and return. Hence, if a stone be dropped in between the convergent faces of the jaws, it will be broken by the next succeeding bite; the resulting fragments will then fall lower down and be broken again, and so on until they are made small enough to pass out at the bottom. The readiness with which the hardest stones yield at once to the influence of this gentle and quiet movement and melt down into small fragments, surprises and astonishes every one who witnesses the operation of the machine.

It will be seen that the distance between the jaws at the bottom, limits the size of the fragments. This distance, and consequently the size of the fragments, may be regulated at pleasure. A variation to the extent of five-eighths of an inch may be made by turning a screw nut, which rises or lowers a wedge, and moves the toggle-block forward or back. Further variations may be made, by substituting for the toggles, or either of them, others that are longer or shorter, extra toggles of different lengths being furnished for this purpose.

The whole length of the machines to the backside of the

wheels, is from eight to eight and a half feet,—height to top of wheels, five feet, width from four to five feet.

The inventors are Messrs. Blake of New Haven, Connecticut, who have many testimonials of the efficiency of their invention from those who have their machines in constant use.

Mr. Hubbard, of the Pacific Mail Steamship Company, corner of Leidesdorf and Sacramento street, is the agent for this State.

Nevada Territory.

The following Extract a truthful and graphic description of the Geographic and physical peculiarities of "Silver Land" is taken from "Sketches of the Washoe Silver mines" by Doct. Degroot.

It is a region of varied geology and strong meteorological characteristics—a land of contrasts, extremes, and apparent contradictions; of mingled barrenness and fertility, beauty and desolation, aridity and storm. Growing side by side, is the cactus and the wild plum, while issuing almost from the same orifice are hot springs and cold; the waters of the one pure and healthful; of the other, nauseating and unwholesome.

In passing over this strange country one is impressed with the idea that he has come too soon. Everything seems crude and unfinished about him; all nature wears a primitive aspect. The rocks, the vegetation—all things are in a transition state. The traveler feels as if he has intruded upon the solitudes of nature before she had fitted them for his reception, or adapted them to the wants of civilized man. The flats which she had platted out for future meadows, and was slowly filling up by freighting the melted snows with debris from the mountains, are as yet but half finished, being only wide-extended marshes or yielding mud lakes. The sage plain, to which the great alchemist was patiently imparting the elements of fruitfulness, drawn from the generous air and the grudging rocks, has arrived only at a central point between utter barrenness and a dubious vegetation—the lichen and the artemisia struggling for subsistence—the lowly pioneers of coming fertility. The summits of the once splintered mountains, rounded into domes by the slow process of disintegration, have come to be planted with the stunted cedar, and their sides to be sown with the wild grass-seeds; which, though they afford ample covert for the hare, and a scanty pasturage for the deer, are little fit for the pursuits of the agriculturist or the habitations of the white man.

All, except a few valleys and mountain meadows, is a wilderness, silent and vacant, over which the mirage dances, and the sand storm sweeps—the one warning the weary emigrant to hasten his footsteps; the other luring him from his path and beguiling him to death. This optical illusion, caused by the reflection of the sun's rays upon the saline particles floating in the atmosphere, is common only in desert regions, where it tantalizes the thirsty traveler with the sight of palatial structures and limpid waters, all of which dissolve into burning air as he approaches the spot of their supposed existence.

For Sale.

A great bargain is offered by a person who spent the summer in the silver mines east of the mountains. Eight hundred feet in various excellent quartz lodes are offered for sale for a paltry sum—sufficient to enable him to make a trip to Cariboo.

For particulars apply at this office.

PACIFIC METALLURGICAL WORKS.

NORTH BRANCH,

Are now prepared to reduce by contract, Gold or Silver Ores or Sulphur. Price of reducing will be as low as the charge of similar establishments in Europe or in the States, thereby saving freight, insurance and interest.

UNION IRON WORKS (ESTABLISHED IN 184

N. E. Cor. First and Mission streets, San Francisco.

PETER DONAHUE, PROPRIETOR.

THE above Establishment has been in successful operation for the twelve years, during which time new and extensive Buildings have been erected, and the latest improvements added to the Works, which enable the undersigned to supply all demands for

BOILERS MACHINERY AND CASTINGS,

Of every description, on the shortest notice, and finished in a style of workmanship that cannot be surpassed.

Quartz Mills, Saw Mills, Threshing Machines, Horse Powers, Grist Mills, Gearing, Malt Rollers, and all kinds of Mill Work, Steamboat Repairing and Blacksmithing, etc.

STEAM ENGINES BUILT AND REPAIRED.

Besides the extensive assortment of Machinery Patterns, attention is called to the new and beautiful designs for Building Castings, Iron Fronts, Columns for Stores, Railings for Balconies and Stairs, Door and Window Sills, Stair Cases, Etc.

P. DONAHUE'S SAFETY STEAM PUMP AND FIRE ENGINE.

C. & G. M. WOODWARD'S PATENT.—This Pump is used for supply Steam Boilers, Mills and Public Buildings, with water. In case of fire arranged to discharge any quantity of water, according to the size, by simply opening a valve connected to the Discharge Outlet. It is suitable both for Maritime and Mining purposes, being used on nearly all the Government vessels lately built, and in Mining operations is used for raising water from shafts, driving Quartz Machinery, etc. ORDERS PROMPTLY FILLED

PETER DONAHUE, Proprietor

OILS AND LAMPS BY LATE ARRIVALS.

STANFORD BROTHERS HAVE RECEIVED

A GREAT VARIETY OF COAL OIL LAMPS of every style of BURN known to the trade.

BRACKET LAMPS AND SIDE LAMPS with the largest burners in use. PARLOR AND STAND LAMPS.—An endless variety of Patterns. CHAMBER LAMPS AND HAND LAMPS.—Very cheap; may be carried about.

CHANDIEJES AND LANTERNS. CAMPFIRE LAMPS OF ALL KINDS. COAL OIL AND CAMPFIRE WICKS. CHIMNEYS, SHADES, GLOBES.—Of every size, style and finish.

200 BARRELS SPERM OIL.—At a lower price than ever before sold in this city.

100 BARRELS LARD OIL.—Of our own importation.

600 TUBS RAPE SEED OIL.—In original packages.

100 BARRELS BOILED LINSEED OIL.—guaranteed pure and free from fish oil.

400 CASES DOWNHILL'S KEROSENE.

800 CASES COAL OILS.—At the very lowest market prices.

1,000 CASES CHINA OIL.—In 2½ gail. tins.

We feel confident in assuring our CUSTOMERS and the TRADE generally that they will find our assortment of LAMPS and LAMP STOCK, as well as OILS and all kinds of BURNING MATERIALS, the most complete it has ever been offered on the Pacific Coast.

Our purchases have been made upon the most advantageous terms, and we are determined to fix our prices at a standard so low that dealers in the line of goods can lay in their Winter Stocks, and have a wider margin profit than they have ever had before.

SAN FRANCISCO, SATURDAY, FEBRUARY 1, 1862.

NO. 20.

On the Origin of Quartz Veins.

At Stigletz, in the district of Ballarat, an overwhelming proof presents itself as to the origin of quartz veins. The formation being harder than is usual on the gold fields, we were enabled to study the subject better; where in a softer stratum disorder presented itself, in this hard rock the eruptive origin of the quartz was plainly discernible. The strata consisted of alternate layers of sandstone and slate, or eliotose rocks including at an angle of about 25 degrees. Counting the various layers of strata as the course of the fissure made in the convulsion of nature (caused by the contracting of the earth's crust on the igneous liquid mass, within which, exerting a force equal on all sides, bursts the weaker part, which it shows generally to be in the secondary rocks) gases and fumes of minerals would be the first discharged from the plutonic fires, in part depositing themselves as condensed on the walls of the opening so made: this takes place with great rapidity, the liquid molten mass of quartz following after, the heat of which causes nearly all mineral substances to fly lightly away, but in nearing the surface, the powerful force exerted has nearly found its balance, and the column of quartz moves slowly, and some mineral substances, which have been condensed from the fumes of minerals arising from beneath and deposited on the walls of the fissure, now take at a less temperature their metallic form, intermixing with the auriferous quartz as lead or other minerals, such as used in fluxes to gather the gold in the furnace. So do the minerals left by fumes again take their metallic form in the quartz dyke, gathering the gold disseminated throughout the mass into small particles or nuggets, again diverting their glittering companion to visit the atmosphere according to the temperature, as it may be, consequently other mineral and stains are seen where nuggety gold is found. And the underwall naturally, as the quartz becomes solid while in motion, be cut and grooved, particularly that part corresponding to the mass in the column above, and, therefore, by clearing away the overlying quartz will be seen a flute-like appearance, grooved on the hard edge of the rock, once rough and now smooth, and of a fluted form, as seen at Stigletz; while the back or overhanging wall, especially near to the surface is upheaved and disordered, and the edge of the stratum running across is carried upward, plainly indicating a force and showing the direction from which it came. The shoots of mineral, or small leaders or veins, in the quartz rich for gold also incline in the same direction as the fluted appearance before named does, but are entirely different from other mineral formations, presenting the appearance of a half molten mass, once gathered together, and then stretched out a few feet or a short distance, as it may be. And again, gold is often found abundant in small particles on the underwall, as if the gold usually disseminated throughout the mass had been gathered by some influence or flux and deposited on the underwall of the quartz dyke; the various effects produced are caused by variations in temperature.

At Stigletz the column of quartz seemed to have cooled while in motion towards the surface, with little or no outcrop; whereas at Ballarat the overflow was generally excessive, and possibly in some cases in a liquid state; this, together with a softer rock would prevent any defined action being seen. But what is wanting in one as a proof of origin is abundantly shown in the other. The pure quartz drift of Ballarat, varying from one foot to fathoms in thickness; what are they but the mark of convulsions, filling the beds of rivers? And again, the layers, one of which I have seen to be greatly impregnated with mineral substances, iron pyrites partly calcined, &c., and basaltic lava flowing over all.

I have given proofs, as seen of the origin of quartz dykes, and have endeavored to account for their apparent richness at or near the surface. As nearly all gold mines are started by rough gold being found at or near the surface, and as ad-

venturers are tempted to a trial of the ground by rich specimens, while a sample of quartz equally rich, if quantity be tested, without its showy qualities, would want its attraction; seeing is believing. A good specimen of gold, as other minerals, is a great attraction, and is often worked, where a more productive vein, lies totally neglected and *vice versa*. The apparent riches in depth may vanish away, and that which was only hidden from our view may present, on further exploration, the all-absorbing spangled appearances. "There it is, there it is," both at surface and at the greatest depth; for such must be the case if quartz is to be considered the mother of gold. Another proof of which is given in the late practical resort of the Port Phillip Gold Mining Company, where it is shown that there is no diminution of produce in depth, the gold being disseminated throughout the mass, therefore to a theoretical observer quartz seems less productive as the specimens or nuggets become more scarce. —London Mining Journal.

The Necessity of Scientific Agriculture.

A correspondent of the Los Angeles Star, says:—As a plant cannot long exist, but in a sickly, retrograding manner, without imbibing nourishment from the soil peculiar to its habits, so communities, without having recourse to the press, cannot progress in any science, but be in a state of dormancy, degeneracy, and decay. By this means alone the transactions of former ages have been transmitted to us, and by no other means can the information which we may acquire, be handed down to future generations, in proportion as they spring up in the path of time.

He who attempts to treat on Agriculture or any of its branches, must be guarded by a triple shield. He must have truth to stand upon, reason to support him, and intelligence to define his position. How many have we seen within the scope of our own observation, who have eloquently written on these, the most useful of all branches of industry, entirely foreign to their vocation? Of such we have many, and but few who are willing to stoop down to the drudgery of experience, and there acquire the knowledge of causes and effects.

Although we have many authors both of foreign and native origin on this science, yet, they are inadequate to the task which this State has yet to perform. We should never base our confidence on any principle as such, but in proportion as it is corroborated by circumstantial evidence. If we rely on those who are totally unacquainted with the soil and climate of this country, we will have a tendency to subvert the pillars upon which the wealth of this State was founded.

Agricultural pursuits are the most pleasing and natural enjoyments for man; they lead him from the haunts of vice, to the solitude of rural scenes, where he beholds in the simplicity of nature the inestimable works of the Creator; and from the boundless thought of action and repose, he begins to trace the causes of things and their effects, and in proportion as he advances, in the same ratio does he see in the distance the end to be attained.

There is no doubt but we must have practical writers upon those branches of industry in this State. And you need not think that because a man is illiterate, he is fit for nothing but manual labor; but from this source derive information.

Do not be mistaken—the more learned you are, and the more labor you perform, the more you will dive into the beauties of this science, the better you will be able to inform others, and thus transmit to posterity the fruits of your acquired information. But our young men of this State are too leared to indulge in such menial occupations. They seek for some more honorable mode of accumulating wealth; yet Agriculture and its branches are the most honorable, and the foundation of all wealth, and will be as long as the creation shall last, or the Pyramids shall exalt their peaks above the turbulent waters of the Nile.

To be an Agriculturalist is to be a benefactor of our race.

This is made manifest in the conduct of Joseph to his brethren. And now, why do we not try to make this country the land of milk and honey, the Pactolus of the Pacific, in order that when our brethren of the East, South, and West, shall be exhausted by internal commotion and shall appeal to us for subsistence, we shall be able to supply their demands, and thus shield them from the miseries into which they have been plunged.

Valuable Tables on Gunnery.

The following tables in these times of war may perhaps be of interest to some of our readers:

It has been ascertained by experiments that the velocity of the ball projected from a gun varies at the square root of the charge directly, and as the square root of the weight of the ball reciprocally.

To find the velocity of any shot or shell.

RULE.—As the square root of the weight of the shot is to the square root of the weight of treble the weight of the powder, both taken in pounds, so is 1600 to the velocity in feet per second.

EXAMPLE.—What is the velocity of a shot of 196 lbs. projected with a charge of 9 lbs. of powder.

14 : 52 :: 1860 : 594, Ans.

When the range for one charge is given, to find the range for another charge, or the charge for another range.

RULE.—The ranges have the same proportion as the charges; that is, as one range is to its charge, so is any other range to its charge, the elevation of the piece being the same in both cases.

EXAMPLE.—If, with a charge of nine pounds of powder, a shot range four thousand feet, how far will a charge of six and a quarter pounds project the same shot at the same elevation.

9 : 6.75 :: 4000 : 3008, Ans.

Given the range for one elevation, to find the range at another elevation.

RULE.—As the sine of double the first elevation is to its range, so is the sine of double another elevation to its range.

EXAMPLE.—If a shot range 1000 yards when projected at an elevation of forty-five degrees, how far will it range when the elevation is 30° 16', the charge of powder being the same.

Sine of 45° x 3 = 100000,
Sine of 30° 16' x 2 = 87064.

Then, as 100000 : 1000 :: 87064 : 870.64, Ans.

EXAMPLE.—The range of a shell at forty-five degrees elevation being 3750 feet, at what elevation must a gun be set for a shell to strike an object at the distance of 2810 feet, with the same charge of powder?

As 3750 : 100000 :: 2810 : 74934, the sine for double the elevation of 249 16', or 659 44', Ans.

AN IMPROVED HORSESHOE.—Mr. R. A. Goodeaough has laid before the Government one of the most practical and humane inventions of the age, "a horseshoe," based upon the principles of nature, by copying the horse's foot, or rather giving the horse a continuation of his foot in iron, at the same time securing his foot-hold, without those unsightly stilts or caulks, besides being cheaper than any shoe ever offered to the public, made either by hand or machinery. The shoe may be made either from the malleable iron or steel, sharpened for all roads—snow, ice, mud or pavement.

The accompanying illustration represents the magnificent premises No. 417 and 419 Montgomery street, into which the enterprising firm of Messrs. Roman & Co., known on this coast, as well as in the Atlantic States, as the first and best publishing house, have moved. A few years since Messrs. Lecount & Strong occupied these premises, and our citizens will again have early reminiscences brought to their minds by a similar business vocation in this locality. As booksellers and publishers Messrs. Roman & Co. enjoy a reputation seldom equaled. In their extensive establishment may be found the works of all authors of note, together with all the standard works, both of Europe and America. We have disposed of our entire edition of the "MINER'S COMPANION AND GUIDE"—a valuable work on mining, metallurgy and engineering, in fact a work designed for the miners on the Pacific Coast, giving treatises for reducing ores and separating the same. They keep however a full catalogue of works by the best of authors, of geological, mineralogical and similar scientific publications.

This firm have a large business connection throughout the Pacific States, in consequence of that they are enabled to dispose of their books on more favorable terms than other wholesale dealers. Our literary and professional citizens will find Messrs. Roman & Co. courteous and affable men, and withal liberal in their dealings. We therefore recommend them to our friends, feeling satisfied that they can rely on all we have said respecting them.

—O—
Arizona.

By Mr. R. Pumpelly—continued from our last.

The defects of this process, as applied at Arivaca, are very great, and are attributable in part to the character of the ore and absence of some facilities. The roasting is performed too hurriedly, and the roving character of the Mexican renders it very difficult to make them good workmen at the furnace, where so delicate a process, requiring long practice, is to be well executed. The percentage of sulphur in the ore subjected to this operation is so very low, that the decomposition of the salt must be imperfect, causing inordinate loss of material, which is very expensive; owing to the small part of lime added during the roasting there cannot but be an unnecessarily large loss of quicksilver. The loss of silver is said to be from seventy to thirty per cent., which destroys the main advantage of the European barrel process over the cheaper Mexican amalgamation; but, by more carefully meeting the requirements of the method, this loss could probably be reduced to at least ten per cent. These works were erected for temporary use, and consequently the amount of manual labor is more than double that which is necessary.

The workmen at the furnace receive one dollar per day of twelve hours; other Mexican laborers twelve to fifteen dollars per month, and to each man a ration of sixteen pounds of flour per week. American laborers are paid from thirty to seventy dollars per month and hoarded.

The cost of salt, which is brought from near the coast is four cents per pound; of copper twenty-five cents per pound, and wood from four to six dollars per cord, delivered at the furnace. The price of quicksilver is one dollar per pound.

The first class ore was formerly smelted at the mine in Castilian furnaces, with the addition of an ore of sulphide and carbonate of lead, litharge and iron ore. The loss of silver was from fifteen to twenty per cent., and the cost of extracting that metal about sixty dollars per ton of ore. The yield, as before stated, was nearly one thousand dollars to the ton.

From the results obtained, in 1859, on one hundred and sixty tons of amalgamated ore, it appears that about \$24,000 worth of silver was produced. The loss of quicksilver equaled one pound (=one dollar) for every forty dollars of silver extracted. The consumption of copper was 1,480 pounds, of salt 32,000 pounds, and of wood three hundred cords.

The production of silver at the Heintzelman mine is estimated at over \$100,000 (not including large amounts of ore stolen and worked in Sonora) but had it been regularly worked and provided with reduction works of sufficient capacity, it might have produced over \$1,000,000 in the same time.

This is the first experiment made in the United States in applying the barrel process to the treatment of argentiferous copper ores, and is it not surprising that, in submitting to it ores of the peculiar character which these possess, and especially when we consider the absence of necessary facilities, we should find in it important defects, many of which are remediable.

No experiments have been made in working this ore by the *patio* or Spanish-American amalgamation process, so that it is not known to what extent the rejection of the present

A. ROMAN & CO.—REMOVAL.

method would prove advantageous; but the results obtained at Arivaca show conclusively that, by remedying the defects within the limits of possibility, and by proper substitution of mechanical for manual labor, the European method can be used with profit in Arizona for ores of this class and containing about one hundred and fifty dollars to the ton.

The same may be said of the ores of many other mines which are free from lead, and in which tetrahedrite or copper-glance is the principal silver bearer.

Near Arivaca there are said to be twenty-five openings on veins worked formerly for gold and silver.

The valley of this ranch is a large plain. The soil rests on clay slate, which is also in part covered by a slight deposit of the usual quartzary. The hills bounding the valley on the north and south are of quartziferous porphyry. This is a fine-grained rock, with pink crystals of orthoclase and quartz crystallized in double pyramids.

The northern line of contact between the clay-slate and porphyry is marked by a bold vein of quartz running east and west. In this are several openings, made previous to the Apache war. The ore which I observed was galena, and its altered products disseminated in quartz. It is said to contain gold. Several quartz veins traversing the porphyry have been worked for gold, as have also the beds of the *arroyos* in the neighborhood.

Arivaca has too little wood for extensive operations. When the Heintzelman mine is again worked, the reduction should be affected at Tubac, where the erection of large works would be an incentive to the opening of many of the mines in that neighborhood.

SANTA RITA.—The mines of the Santa Rita are situated in and around a beautiful valley, ten miles east of Tubac, and among the foot-hills of the Santa Rita mountains. The valley and the hills to the north are of a metamorphic quartziferous porphyry, while the hills to the east consist of a feldspathic rock. It is in these two formations that the veins occur.

The hills to the south are formed in part by the porphyry conglomerates already mentioned, and in part by a remarkable feldspathic porphyry. This last rock has a compact light gray ground, bearing numerous crystals of a white triclinic feldspar and small prisms of hornblende, but entirely free from quartz. It is apparently older than the conglomerates. In it no veins have been discovered.

The veins in the feldspathic rock are very numerous, and have with few exceptions a nearly east and west course. Their dip is nearly vertical, and they vary from ten to twen-

ty-five inches in thickness. The gangue is almost entirely quartz, and the ore generally argentiferous gray copper and galena. When this last mineral is unaccompanied by the tetrahedrite, its yield is rarely over 0.1 per cent. of silver, but when occurring in proximity to that mineral it contains often from 0.5 to 0.75 per cent. The gray copper ores vary from light steel gray to tarnished black, and contain from one to over two per cent of silver. This mineral, when associated with galena in decomposing, is replaced by a porous vitreous substance of yellowish green color, and consisting principally of antimonate of lead, containing from one to two per cent. of silver. The "crystal vein" is of a massive ore of galena, with about twenty per cent. of zinc-blende and copper pyrites. The gangue is quartz, but no tetrahedrite was observed. This galena is very poor in silver, containing from 0.1 to 0.2 per cent. only. Thus to the presence of tetrahedrite is apparently due the silver of these ores. In this vicinity are several veins of *gossan*, or oxyd of iron, the cappings of deposits of ore, and themselves containing a moderate percentage, about one per cent., of silver. The wall rock of these veins is a crystalline granular rock, and has a slightly bluish tint on its fresh fracture, while its weathered surface is discolored by oxyd of iron proceeding from the alteration of the little hornblende contained in the rock. It also has a little mica and disseminated particles of magnetic iron. It thus approaches in composition to a dioritic rock.

The veins which occur in the metamorphic porphyry have, so far as opened upon, shown a different character from the above. The porphyry itself has a compact gray ground, impregnated with carbonate of lime, and bearing unnumbered crystals of opaque, white, triclinic feldspar, grains of quartz and dark gray mica in six sided plates. It contains also specks of magnetic iron.

Veins in this rock are of quartz, often comby, containing a black tetrahedrite, with from four to eight per cent. of silver, and are in places impregnated with galena in small cubes, which contain 0.5 per cent. of silver. The gangue is discolored by the blue and green carbonates of copper and black manganese, with films of the sulphuret of silver and of native silver. Experiments made on various quantities of these ores in the *patio*, with the use of salt and mercury, without roasting or magistral, have given an average yield of fifty per cent. of silver, and comparison with correct assays shows that from eighty to eighty-five per cent. of the silver contained can be extracted by the simple action of salt and mercury. This fact would seem to show that the silver of this tetrahedrite is contained as mechanically mixed sulphuret. Some of the veins in this porphyry have been thrown out of position by a large dyke of granite.

Laws of Friction.

1. Friction is greatly influenced by the smoothness or roughness, hardness or softness of the surface rubbing against each other.

2. It is in proportion to the pressure or load, that is, a double pressure will produce a double amount of friction; a triple pressure a triple amount of friction, and so of any other proportionate increase of the load.

3. The friction does not depend upon the extent of surface, the weight of the body remaining the same. Thus if a parallelopiped, say of four inches in width and one inch thickness, should by any means, be made smooth, and laid upon an ordinary smooth plane and the weight hung over a pulley, it will require the weight to draw the body along, to be equal, whether it be laid on its side or on its edge.

The experiments of Vince led him to conclude that the law, as thus laid down, was not correct; but those more recently performed justify the conclusion that it is so; the deviations being so trifling as not to affect the general result.

4. The friction is greater after the bodies have been allowed to remain for some time at rest, in contact with each other, than when they are first so placed; as, for example, a wheel turning upon gudgeons will require a greater weight to start it after remaining for some hours at rest, than it would at first.

The cause of this appears to be that the minute asperities which exist even upon the smoothest bodies, gradually sink into the opposite spaces, and thus bold upon each other.

It is for the same reason that a greater force is required to set a body in motion than to keep it in motion. If about one third the amount of a weight be required to move that weight along in the first instance, one-fourth will suffice to keep it in motion.

5. The friction of axles does not at all depend upon their velocity: thus a rail-road car travelling at the rate of twenty miles an hour, will not have been retarded by friction more than another which travels only ten miles in that time.

It appears therefore, from the last three laws, that the amount of friction is as the pressure directly, without regard to surface, time or velocity.

6. Friction is greatly diminished by unguents, and this diminution is as the nature of the unguents, without reference to the substances moving over them. The kind of unguent which ought to be employed, depends principally upon the load; it ought to suffice just to prevent the bodies from coming into contact with each other. The lighter the weight, therefore, the finer and more fluid should be the unguent, and vice versa.

Water-Pressure Engines.

The water-pressure engine is peculiarly applicable to mountainous districts where high falls can be procured and will be found highly economical for pumping, drawing, and many other mining purposes. In this machine the power is obtained by means of a descending column of water acting by its weight on a piston working in a closed cylinder. As water may be considered a non-elastic fluid, care should be taken so to arrange for its admission and emission, as to cause no shock to the machinery, and at the same time to produce the highest effective result.

The credit of inventing this apparatus appears to belong to Hungary; but various German engineers have also devoted much talent to the improvement of its construction, and have succeeded in bringing this machine to a great state of perfection. A Mr. William Westgarth erected the first pressure engine in England, in the year 1765. Smeaton afterwards modified and improved Westgarth's plan, in an engine which he constructed for Lord Irwin, of Yorkshire. Trevethick appears to have been the next engineer who gave these machines particular attention, and has since been followed by Mr. Dean, Mr. Armstrong, and Mr. Darlington.

The pressure engine may be either single or double-acting. In the former case the piston moves in one direction only by the pressure of water, and returns by the action of a counterpoise weight; whilst in the latter the piston is impelled in both directions by the force of a column of water. Sometimes, also, instead of one, two single-acting cylinders are employed, the piston rods being connected by means of a cross-head; in other cases the action of one piston is downwards, whilst that of the other is in a contrary direction.

In laying the pressure column care must be taken to introduce the top into the supply reservoir some distance below the surface of the water, in order to prevent the admission of air; and also to fix a grating in the mouth of the pipe, to keep back pieces of wood, ice, &c. In addition to this, a sluice valve should be fixed so as to shut off the water from the pressure column when required; whilst the metal forming the pipes must increase in thickness in accordance with the pressure to which they are severally exposed; the soundness and strength of each pipe should also be proved before leaving the foundry.

The capacity of cylinders ought rather to be influenced by their lengths than their diameters, whilst the maximum velocity of the piston should not exceed 140 feet per minute.

Every part of a pressure engine should be made particularly strong, and the cylinder be of greater thickness than is theoretically necessary, in order to withstand any concussion arising from the sudden entrance or stoppage of the water. The whole of the substructure must also be sound and massive.

The main piston is usually of the ordinary character, supplied either with metallic rings, leather, or hemp packing.

The admission and discharge of water from the cylinder is effected by cocks, valves or pistons, acted on by proper plunger gear. For large engines, however, piston valves are preferable, since they are less liable to derangement. These are usually made in pairs, in order that the water from the pressure column may pass between them without bringing any weight or strain on the gear work. Valve gearing is of three kinds, technically known as tumbling gear, spring gear, and pressure gear. The first consists of a weighted pendulum or beam, which is connected with the valves, and by falling a given distance produces the differential movement required to effect the up or down stroke of the engine. This principle was employed by Trevethick in the engine he erected in Derbyshire. Spring gear implies that motion is partially produced by the action of springs: this plan, however, has not been extensively employed. The third method comprises pressure gear, which usually consists of an auxiliary apparatus, composed of a small cylinder, placed in direct communication with the descending column, into which are introduced two piston valves moved by the reversal of a ball, so as to allow water from the column to act upon the surface of the valve piston, or otherwise, so that the communication between the piston and the pressure column may be closed.

One of the most powerful hydraulic single-acting pumping-engines erected in England was designed by Mr. J. Darlington, for the Alport Mines, Derbyshire. Its general dimensions were as follows:—cylinder 50 inches diameter; stroke 10 feet; plunger pole, 42 inches diameter; pressure column, 132 feet high; length of plunger lift, 140 feet. The total pressure on the piston in this case amounted to 50 tons, or 56 pounds per square inch, and the speed per minute multiplied by the weight lifted, and divided by 33,000, give 168 as the net horse-power. Its average speed was four strokes; but it could if necessary, be raised to seven strokes per minute, without causing any perceptible shock in the descending column. The piston rod worked through the bottom of the cylinder, and was directly connected with the pump rod, to which was attached a weighted plunger pole. In order to prevent impact, and secure smoothness of action, the water from the descending column was slowly admitted on the piston, and by a double system of valves brought to a gradual state of rest. Into a nozzle placed in front of the main cylinder were fitted inlet and outlet cylindrical valves. Right and left of these valves, sluice valves were fixed for regulating the speed of the machine. Between the main cylinder and sluice valves, were introduced two small 5-inch inlet and outlet piston valves. The cylindrical and piston

valves received motion by a rod depending from a vibrating beam connected by a rod with the top of the main piston, and by catract gearing placed beneath the valve nozzles. When the water was admitted to the main cylinder, the inlet cylindrical valve gradually opened, the stroke of the piston was then made to a given point, when the action of the catract closed the valve, and, by displacing the 5-inch pistons, opened the apertures so as to allow the water to be continued from the column to terminate the stroke. When this was done similar movements occurred in the outlet valve and piston. The valves were made of brass, with a thin feather-edged beat, and kept tight by a boss projecting from the nozzle into which packing was inserted, and pressed down by a projection in the under surface of the valve bonnets. The water thus acted on the outer surface of the valves, between the zone of packing and the seatings, and when opened passed through the latter.

For smaller machines, Mr. Darlington has adopted a different construction. His most recent engine, was designed in 1851 for a mine in Cornwall. The cylinder stands on two cast-iron bearers fixed across the shaft, the piston rod works through the cylinder bottom, and is a continuation of the pump rod. In front of the main cylinder is a smaller one with differential diameters for the admission and emission of water, and right and left are sluice valves for regulating the speed of the engine. Connected with the second cylinder is a small 3-inch auxiliary cylinder, provided with inlet and outlet regulating cocks. One of these engines is now in operation at the Minera Mines in North Wales. The cylinder is 35 inches diameter; length of stroke 10 feet; pressure column 227 feet high. Its average speed is 80 feet, and maximum speed 140 feet per minute. The pressure of water on the piston, is 98 pounds per square inch, giving a total weight on the piston of about 40 tons. This machine requires no personal attendance, the motion being certain and continuous as long as the working parts remain in order; consequently the cost of maintaining it is of the most trifling character.

Damage to Ditch Property.

We learn that the damage to ditch property, caused by the late floods, has been immense throughout the interior. Our neighboring county of Butte has suffered somewhat. The Feather River and Ophir ditch company are heavy sufferers, their extensive ditch, running from Feather river to Oroville, and supplying that town as well as the immediate diggings, with water, has been injured to a great extent. The dam on Feather River has been carried away, together with flumes. The Forbestown ditch has also been much injured. The Walker & Wilson ditch, leading from Butte creek to St. Clair's and Thompson's Flats, opposite Oroville, we are gratified to learn, has not suffered much, as it is thought fifty dollars will cover all damage sustained. This ditch is owned by our enterprising townsman, Messrs. Walker and Wilson, old and successful merchants of this city, and we congratulate them upon their happy escape from the destructive floods.

Lewis Cunningham, Esq., of this city, is president of the Feather River Ditch Company, and principal stockholder. He informs us that the miners in the vicinity of Oroville will be deprived of water, he thinks, for at least three months. This is a heavy loss on the miners and the stockholders, and may be recorded among the many calamities that befel unfortunate California during the dark and dismal season of floods that visited her during the winter of 1862.—*Cal. Express.*

The Fly-Wheel, and its Use.

Many have supposed this wheel to be an increaser of power, whereas it is, in reality, a considerable destroyer of it; which appears evident, when we consider that it has no motion of its own, but receives all its motion from the first mover, and as the friction of the gudgeons, and the resistance of the air are to be overcome, this cannot be done without the loss of some power; yet this wheel is of great use in many cases; namely:

1st. For regulating the power where it is irregularly applied; such as the treadle and crank moved by the foot or hand; as in spinning-wheels, turning-lathes, flaxmills, or where steam is applied by a crank to produce a circular motion.

2d. Where the resistance is irregular, or by jerks, as in saw-mills, forges, slitting-mills, powder-mills, &c., the fly-wheel by its inertia, regulates the motion; because if it be very heavy, it will require a great many little shocks or impulses of power to give it a considerable velocity; and it will, of course, require as many equal shocks to resist or destroy the velocity it has acquired.

While a rolling or slitting mill is running empty, the force of the water is employed in generating momentum in the fly-wheel; which force accumulated in the fly, will be sufficient to continue the motion without much abatement, while the sheet of metal is running between the rollers; whereas, had the force of the water been lost while the mill was empty, its motion might be destroyed before the metal passed through the rollers. Where water is scarce, its effect may be so far aided by a fly-wheel, as to overcome a resistance to which the direct force of the water is unequal, that is, where the power is required at intervals only.

A heavy water-wheel frequently produces all the effect of a fly-wheel, in addition to its direct office.

Mining Companies and Associations.

Office of the Bullion Gold and Silver Mining Company, 410 Montgomery street, San Francisco, Jan. 13, 1862.—Notice is hereby given that at a meeting of the Board of Directors, held on the 11th inst., an assessment of ten cents per share was levied on the capital stock of this company, one half of which is called forthwith.

By order of said Board.

C. S. HIGGINS, Sec'y.

Office Cedar Hill Tunnel Mining company, No. 509 Sacramento street. An assessment of Two hundred and fifty dollars per (original) share has been levied by the Trustees, payable as follows: Twenty per cent. on the 15th of January, and twenty per cent. on the first of each month following until paid in full.

CHAS. L. FARRINGTON, Sec'y.

San Francisco January 14, 1862

Office of the Falls of Clyde Consolidation Gold and Silver Mining Company, New No. 533 Washington street, San Francisco, January 3rd, 1862.—At a meeting of the Board of Trustees of the Falls of Clyde Consolidation Gold and Silver Mining Company, held January 3rd, 1862, an assessment of one cent of one per cent. on the capital stock of the company—being twelve and one half cents per share—was levied, payable within thirty days from this date, at the office of the company in this city.

W. L. DUNCAN Sec'y.

SHAREHOLDERS of the Osceola Gold and Silver Mining company are hereby notified that the meeting of the Trustees of said company in Virginia city, on the 2nd inst., an assessment of twenty cents a share was levied on the capital stock of said company, payable on or before the 20th instant to the Treasurer, at his office in Gold Hill, or to D. H. Russell, Virginia city.

Shareholders failing to pay the assessment at the time required, are hereby notified that so much of their interest in said company as will be sufficient to pay the amount of their delinquencies will be sold at public auction, in front of the saloon of Ludington & Russell, in Virginia city, on Saturday, the 10th day of December next, between the hours of twelve and three p. m.

J. N. WATKINS, Treasurer, Osceola G. & S. M. Co. Virginia city, Nov. 2, 1861.

RATES OF OCEAN PASSAGE.—The prices of passage on the steamers of the P. M. S. S. Co., through to New York, are as follows: First cabin, deck room \$258 50, main deck room, \$233 25; second cabin \$180 75; and steerage, \$128 25. To go to New York around Cape Horn in a clipper ship, first cabin, costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage to China costs from seventy-five to one hundred and twenty-five dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage to England costs about \$150.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any local information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers! This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Lock Box 537, P. O.

Room 24, (formerly) U. S. Court Building, Corner of Washington & Battery streets, San Francisco.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....FEB. 1, 1862.

The MINING AND SCIENTIFIC PRESS published is at 522 Merchant bet. Montgomery and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York *World*, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the Press will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

REMOVAL OF THE "PRESS" AND PATENT AGENCY.

The business of this office having become quite extensive, it therefore made it incumbent upon us to remove from our offices in the Government House, where we had scarcely room enough to do our regular office business. We occupied said premises for nearly two years, and were really loth to leave them. Circumstance have placed us so that we now can enjoy separate offices for the printing of our MINING AND SCIENTIFIC PRESS; and the applicants for letters patent need no longer be interrupted by the thousand and one inquiries heretofore made, while we occupied said offices.

We have moved our printing rooms to Merchant street, No. 522, between Sansome and Montgomery up stairs, and the

PACIFIC PATENT AGENCY

and the Editorial rooms are now eligibly situated in the former U. S. Court Building, northeast corner of Battery and Washington streets, in room 24. All persons having business with us will favor us with a visit as early as convenient. Letters will be addressed to us in accordance with the above.

Taxing of Mining Claims.

The recommendation of the Secretary of the interior, for the taxing of mining claims, calls forth much comment from our interior exchanges. We will briefly say in regard to this matter, that an indiscriminate taxing of mining claims in our opinion would be a great wrong. We all know or ought to know that all mining claims are not paying institutions, on the contrary, that thousands of dollars, and years of labor, are frequently expended in the opening and prospecting of a

single claim, which when the supposed rich spot is reached proves to be entirely worthless, and the money expended and labor performed a total loss. Again, other claims may be rich in a certain spot or locality, while the balance of the ground contains no mineral whatever. Placer mines are at the best, uncertain property, and the proposition to impose an additional burthen on our hard working and indefatigable miners can view in no other light than as an imposition, to call it by no harsher term.

With quartz mining the case is somewhat different; still the matter of making the burden bear evenly and justly would be attended with much difficulty, and should be carefully approached.

The following from the Sierra Citizen expresses an opinion coinciding with our own on the subject:

"As to taxing mining claims, it is a difficult matter to get at. The miner is already taxed for the gold he takes out, and in the soil itself he has no interest except to take gold therefrom, and therefore ought not to be taxed for the claim. Claims in about one-third the cases prove worthless, and men now spend health, and time, and money, often but to be disappointed. Bed rock tunnels by the thousand are counted—we mean worthless ones. It is but right that every one in our government should assist in its support, yet should he not be taxed in proportion to what he possesses, and not for a fictitious valuation of a claim, which may not be worth one dime? Let him be taxed for the money he has made from it—this is the law and it is fair. If he is willing to work for years on expectation, let him do so without taxing him for his expectations; and when he gets money tax him, and he won't growl."

Our Quartz Mining Interest.

The mineral resources of this State and in our adjoining neighbor—Nevada Territory—are at the present time being developed with unexampled rapidity: every month, year every day, adds considerably to the number of mines entered upon with the almost certain assurance, that if worked properly the result will prove them to be a profitable investment for capital.

Discoveries of mines rich in gold, silver, copper and other metals have been very numerous the past two or three years. The immense wealth that may be realized therefrom, the great amount of steady employment they would give to our already numerous mining population, the market they will afford for the produce of our farmer, to say nothing of the immense amount of machinery requisite in their development, all materially concern every man throughout the Pacific slope, not the miner or capitalist only, but every trader, mechanic, farmer and manufacturer as well.

To aid the early and successful development of this hidden wealth is our desire and pleasure, we therefore never tire in devoting our time, and cheerfully give space in our columns to matter of whatever kind, which has this object in view.

To make mining remunerative, it is necessary to carry it on with skill, caution and economy. Skill and good judgment are the first requisites in commencing mining operations; surveys must be made, proper points selected for piercing the mine at the right depth, to facilitate its working and to drain any water that might interrupt. Caution is necessary to secure the work as it progresses against accident, such as caving, filling the shaft with water, foul air, etc.

Economy is likewise an item not to be overlooked; it, however, should not be carried to excess.

The work should be conducted as rapidly as possible; its supervision should be entrusted to a practical, intelligent and honest man, one who aside from his other duties could assort the ores when the vein is reached.

All these are pre-requisites which are essential; minor requisites will as a matter of course suggest themselves as the work progresses; for in mining operations much is to be learned daily.

The foregoing are hints as to the working of a mine based upon the presumption that capital is at the command of those engaged therein. To engage in mining enterprises without means is indeed a hazardous undertaking.

It is a matter for regret that those who have capital at their command, do not look at this great interest of our State—and of our neighbor, whose growth and prosperity is equally our gain—with more favor. From personal obser-

vation we have become convinced that the mines of Nevada Territory and the Eastern Slope are principally owned and occupied by men of limited means; this is a great drawback on the early development of the riches there hidden, and should not be.

We are moreover convinced that the wealth of the Eastern Slope is immense, therefore it behooves every well wisher of our common interest, to aid to the extent of his means in their development.

In view of these things we would impress it upon the minds of our capitalists, that it is not only their duty to become acquainted with these localities and their resources, but that it may be made a matter of profit to them as well, by investing at least a portion of their means in enterprises of this sort. They should remember that our placer mines are yearly becoming less productive, and that in order to make up this deficiency, it is doubly necessary to open new resources, all of which would result in our general prosperity.

The Effects of the Late Storms and Floods on Mining Interests.

We have noticed a paragraph going the rounds of our exchanges, in which it is anticipated that new mines will be discovered through the medium of the late floods. Now the author either knows nothing whatever about the subject and the nature of our mines, or else merely wrote the paragraph for buncombe. Let us ask in what way could new mines have been developed by the late floods? We confess our inability to conjecture how it could have been done. It is true that extreme dry diggings could be worked this winter to better advantage than during any previous season, but in most instances these diggings have been known for years, and were only not worked heretofore because water could not be had; for this reason the heavy rains that have fallen during the past two months have undoubtedly been a blessing to the mines of such counties as Mariposa, Merced, Stanislaus and Tulare, where these kind of mines are abundant. Again the floods may in many places have washed away large deposits of tailings, thereby leaving the gold contained therein, at, or near the locality, which may now be gathered with much less labor and cost than would otherwise have attended the operation: but in only these two instances have the mining classes been benefited by the late floods. These benefits are small as every one can see compared with the losses sustained. The truth is more injury has been suffered by those engaged in mining enterprises than by the agriculturalists of our State. Mills, ditches, dams, head rock flumes, sluices and tools of every description used in mining, have been swept away.

Banks and tunnels have caved, tailraces filled up, in short the destruction of property in the mountains has been general and the loss entailed immense; operations of every kind are retarded; their damage must be repaired before mining can be carried on again as usual; to do this will require several months time, and the very time too when miners are the most successful.

While, on the other hand, farmers can sow or plant as late as March and April, and still realize a good crop; for these reasons we think it ought to be apparent to every one, that if any class is entitled to more aid or commiseration than another, it is the mining community of the State.

It is proper that the merchants of San Francisco should look at the matter in this, the right light, and if in their power, extend to the merchants and traders of our mining counties, as much time in the matter of payments, &c., as possible; they want and must have time to recuperate; for, if indecent haste is made to collect what they may be owing, it is plain that more ruin must follow and he added to the already large amount entailed by natural causes.

A Novel Sight.

On Monday morning last, snow was visible the whole length of the Contra Costa range of hills opposite this city, indeed it did not disappear for several days. The air in the meantime, even in our city, partook somewhat of a wintry climate. Ice could be seen on some of our streets during the whole of Monday and Tuesday. It is said to have been the coldest spell of weather ever experienced in this city, which we are inclined to think correct, at least as far as our experience extends.

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends there wish disinterred, are informed that I have the most complete registry in existence of graves in that cemetery, having added to my own records by purchase, the books of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard, work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology: (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miners Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

THE MINER'S COMPANION.—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer: together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 33 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treats of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

A BOOK FOR THE MINES.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat, modest, and volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

NEW AND VALUABLE MINING BOOK.—We have been presented with a mining book, just published by the enterprising publisher and proprietor, the "Mining and Scientific Press" of San Francisco. The title of the work is the "Miner's Companion and Guide, and treats of California Mines exclusive. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and it doubt will meet with great sale.—[San News.

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout our mining towns for its merits and usefulness. We earnestly commend it to those who are practically interested in bringing to light from Mother Earth's treasured soil its hidden treasures.—[Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual loss was only \$4,520 35, being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,273 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,048 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths fine. 3cts per oz.
" from 300-1000ths. to 750-1000ths fine. 7cts " "
" " 750-1000ths to 950-1000ths " 14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 8cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

CIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our extensive establishment, we can confidently announce to the public we now have
Best Foundry and Machine Shop on the Pacific Coast.

Upward of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this of the Rocky Mountains.
We make to order, and have for sale, High and Low Pressure Engines, Marine and Stationary; Straight Quartz Mills of all sizes and kinds; Stamp-mills and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness in making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gangs, 1, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per acre, and more perfectly than any now in use. One of these shingle machines is seen in operation at Metcalf's mill in this city.
No. 1 Amalgamators, with the latest improvements; Howland & Hanscomb's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now so.
Quartz Screens, of every degree of fineness, made of the best Russia Iron, Wheels and Axes of all dimensions; Building Fronts; Horse Powers; Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Patents; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.
Steamboat work promptly attended to.
Thankful to the public for their many past favors, we would respectfully ask a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.
The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be holed, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter bar being hinged to the machine, can be packed up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.

Booksellers, Importers, Publishers,

507 MONTGOMERY STREET,

SAN FRANCISCO.

We have for sale, together with an immense variety of Works in every department of Literature, the following, any one of which will be forwarded by Mail or Express as desired:

- A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. By John Arthur Phillips, F. C. S. Illustrated.
- A Treatise on Metallurgy, Comprising Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman, Mining Engineer. Illustrated with 377 wood engravings.
- Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlingston. Illustrated.
- Manual of Practical Assaying; Intended for the Use of Metallurgists, Captains of Mines, and Assayers in general. By John Mitchell, F. C. S. Illustrated with 360 Engravings.
- A System of Mineralogy, comprising the most recent Discoveries; Including full descriptions of Species, Chemical Analyses and Formulas, Etc. Et By James D. Dana, A. M. Illustrated with 600 Engravings.
- Rudimentary Treatise on the Metallurgy of Copper. By Dr. Robert H. Lanc born.
- The Discovery and Geognosy of Gold Deposits in Australia, with comparison of the Gold Regions in California, Russia, India, Brazil, Etc.; Including a Philosophical Dissertation on the Origin of Gold in Placer Deposits, and in Quartz Veins. By Simpson Davison.

Books imported to order on short notice.

DEVÖE & CO.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC American Patent Agency of Messrs. Mun & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.
[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the Inventors of the United States

ap25

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour ter arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and ye simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Opbir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson, }

FRONT STREET BLOCK.

We illustrate herewith another splendid edifice, recently erected by Mr. Mathewson of this city, and graces the most extensive business streets in this city—Front street; it is elegantly situated between Clay and Washington sts. These buildings are of two stories, and their basements elevated considerably over the grade, and are perhaps the best storage vaults now in this city. The firms now partially occupying these premises are familiar to us, and have been favorably known on this coast as strict and faithful business men, and enjoy a reputation for their liberality and urbanity, in business relations with their numerous patrons, seldom achieved.

Messrs. Cutter & Smith occupy corner Clay and Front, are extensively engaged in the wholesale of provisions, groceries, breadstuffs, etc. Messrs. Bray, Brothers, have also an office in the same premises.

Messrs. B. Wellman & Co., are similarly engaged, and have an excellent supply of provisions, groceries, etc.

Messrs. Dodge & Shaw, have an extensive trade in butter, eggs, cheese, lard, cocoa, etc.

Messrs. Sneath & Arnold, are favorably known in this city as well as at Sacramento, as dealers in first quality wines and liquors, as well as provisions, etc.

Last, though not least, are situated Messrs. Webster & Co., including our "handsome friend, Nudd." This firm is noted for keeping the best assortment as well as the choicest quality of fine liquors, wines, champagnes, etc., now to be had in this market. Merchants from the interior coming to this city for purchasing, will find the above firms the men to deal with in their various vocations. They can rely upon being fairly treated, and upon accommodating terms. Their stores are the most centrally located in the business part of this city, and present altogether the neatest and most spacious warerooms in that street. We wish the enterprising firms, whose names appear above, success in their new warerooms.

A New Amalgamating Process.

Mr. John Leclerc, the inventor of a new quartz crusher and amalgamator, did us the honor a few days since to exhibit in our office his process of amalgamating and extracting the mineral contained in a small parcel of pulverized quartz.

To the pulverized matter is first added some chemical agent (which is his secret); the whole is then warmed to a certain temperature, then placed into a revolving cylinder or chamber, with a sufficient quantity of mercury. The whole is well mixed while dry by the revolving of said cylinder, then some warm water is added—the mass still shaken; finally the chamber is filled with water, and after being thoroughly mixed is drawn from the cylinder and left to stand until the mercury and amalgam settles to the bottom, when it is washed from the debris and retorted in the usual manner.

In his machines, instead of warm water, steam is used in the chamber which is considered essential, as it augments the volume of mercury, and otherwise stimulates the process of amalgamation.

The whole process is extremely simple, yet in our estimation is very efficient. The inventor asserts that from the most difficult auriferous ores, he is able to save all the pre-

cious metals to within five per cent., and in ordinary ores the loss to be still less.

Mr. Leclerc is a resident of this city, is intelligent, and seems to understand the business of crushing quartz and amalgamating the mineral thereof, and desires us to say that he will be happy to demonstrate the perfectness of his process to any one interested in the matter, if they will call on him. Any further desired information can be had by applying to this office.

Our Paper.

Every mechanic in the city and State should become a subscriber to the MINING AND SCIENTIFIC PRESS. Much matter that is interesting, such as new inventions, improvements in machinery, with engravings and descriptions thereof, articles of mining, in short useful knowledge of every description, continually find space in the PRESS. We devote much time and attention to the dissemination of useful and—to the mechanic—valuable information, in return for which source we should be aided by them at least to the extent of receiving their names as permanent subscribers.

Miners and manufacturers also will find it advantageous to read our paper, for which, as a matter of course, we want them to pay by the month or year.

The subscription price is only four dollars per annum. It is delivered to subscribers throughout the city at fifty cents per month.

The Cornish System of working Mines

I was rather surprised to find in the Journal of Aug. 17 a letter from Mr. Hopkins, condemning the system in which mines are worked in Cornwall and Devon, and placing the managers of those mines half a century behind those who have the management of coal mines, &c., in the North of England and Wales. Mr. Hopkins acknowledges that the Cornish miners have paid great attention to their pumping appliances and dressing, and this, he says, might be left to Cornishmen; but he would recommend the transference of management of working to North countrymen (colliers). It would be almost as good a policy to send Cornish miners to manage cotton mills in Lancashire as it would be to send colliers to manage copper, lead, and tin mines in Cornwall. There is scarcely any comparison between working of coal beds and working of copper and other mines in Devon and Cornwall. Surely the most simple of all mining is the working of coal beds, and the most ignorant Cornish miner would be able to carry out such a work; but, on the other hand, there is a great contrast in the Cornish and Devon mines, where the various lodes are so thrown about by slides and cross-courses that it requires men of experience to carry out the workings.

Mr. Hopkins charges us with the old system of mining using harrows and kibbles. But this is not general in the mines of Devon and Cornwall; for the last forty years the skip has been in use in Wheal Frickadrip Copper Mine, Devora, working at a depth of 240 fms., each skip carrying from 1½ to 2 tons of stuff; also in Devora Great Consols, where they have been sampling 4000 tons of copper ore per month, besides many thousand tons of poor stuff drawn to surface in the same month. We might almost amuse tons with many of the large collieries, therefore we are not so far behind on this point as Mr. Hopkins might suppose. With regard to man-engines, they would not be suitable to all large mines; such as Devora Great Consols, where men are thickly scattered, working for two miles in length, they would be of little use.

Mr. Hopkins also refers to Australia and America, to show that the Cornish are behind in the working of gold quartz

reefs, &c.; but, as I have been in the mines both of Australia and America, I can testify to the fact that there are no such countries so well qualified to carry out the various mining operations as the miners of Cornwall and Devon. Who ever heard before of the Devon and Cornish being behind in mining; and Mr. Hopkins may rest assured they have nothing to learn in mining from any country in England or Wales. The mining world has been chiefly supplied with engineers, agents, and miners from Devon and Cornwall; men who have thorough knowledge of mining with all its latest improvements, and have generally given satisfaction to the companies that have employed them. *London Mining Journal.*

Of Spouting Fluids.

Spouting fluids observe the following laws:

1. Their velocities and powers, under equal pressures, are equal perpendicular heights, and equal apertures, and are in all cases.
2. Their velocities, under different pressures or perpendicular heights, are as the square roots of those pressures or heights, and their perpendicular heights, or pressures as the squares of their velocities.
3. Their quantities expended through equal apertures, equal times, under unequal pressures, are as their velocities simply.
4. Their pressures or heights being the same, their quantities are as their quantities expended.
5. Their quantities expended being the same, their pressures, or height of their head directly.
6. Their instant forces with equal apertures, are as the squares of their velocities, or as the height of their head directly.
7. Their effects are as their quantities multiplied by the squares of their velocities.
8. Therefore, their effects or powers with equal apertures are as the cubes of their velocities.
9. Their velocity, under any head, is equal to the velocity that a heavy body would acquire in falling from that height.
10. Their velocity is such, under any head or height, will pass over a distance equal to twice the height of the head, in a horizontal direction, in the time that a heavy body falls the distance of the height of the head.
11. Their action and reaction are equal.
12. They being non-elastic, communicate only horizontal force by impulse, in striking obstacles; but by gravity produce effects equal to elastic or solid bodies.

COLORADO MINES.—By recent arrivals from these mines we learn that claim-holders are busily engaged in prospecting and developing their recent discoveries. The lodes tend to be richer than the most sanguine anticipated; a few companies have already erected adit shafts, and we expect, in this handling the golden metal. In a few weeks time we know something definite from this locality.

ROYAL HOTEL.
VICTORIA, V. L.

JAMES WILCOX

PROPRIETOR

THE ABOVE HOTEL is conducted on the most improved plan; is situated on Wharf street; of easy access to all new arrivals in the immediate neighborhood of all the wharves. The proprietor informs the miners of California and traveling public, who intend to visit Victoria, that he has superior accommodations for single and married gentlemen, families, with or without board.

Guests entertained at the following rates: Board per week six dollars; Board and Lodgings, \$8; Board per day, \$1; Lodgings, 50 cents. The hotel is furnished with Wines, Spirits, Malt Liquors, Cigars &c., all of the best quality.

N. B.—The Building is Fireproof.

SPECIAL NOTICE.

HIGHLY IMPORTANT INVENTION IN DENTISTRY.—Dr. D. STEINBERG & FICHEL, begs leave to announce to the citizens of this city, that letters patent for valuable improvements in mechanical Dentistry were granted him 12th of November last.

This invention consists in the application of GEM ENAMEL to gold plates, artificial teeth, and are acknowledged to surpass all others in use, for beauty, style and exactitude of fit; their weight compared with others, are far more durable by the addition of the gum enamel. Specimens of valuable invention may be seen and examined at the dental office of the undersigned, No. 648 Washington street, near Kearny. Great care and attention is devoted to the perfect filling of teeth. Teeth extracted by the new process.

STEINBERG & FICHEL,
Practical Dentists,
648 Washington st., near Kearny.

SHAKSPEARE SALOON

CHAS. DUVEENECK.

Billiards, Fine Liquors and Havana Cigars

LYCEUM BUILDING,

Cor. Montgomery and Washington

For Sale.

A great bargain is offered by a person who spent the summer in the silver mines east of the mountains. One hundred feet in various excellent quartz lodes are for sale for a paltry sum—sufficient to enable him to take a trip to Cariboo.

For particulars apply at this office.

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, FEBRUARY 8, 1862.

NO. 21.

The accompanying illustration is another striking evidence of our California world-renowned inventions, and well compares with the first discoveries of this era, for its mechanical as well as practical features. In our estimation it is by far the most valuable agricultural implement yet invented, and throws into the shade the thousands imported in this State. John Tustin of Petaluma, a most ingenious mechanic, is the inventor of this machine. It has cost him ten years of hard thinking to overcome the existing difficulties and disadvantages in such machines. The patent for this invaluable invention was granted to the inventor on the 12th day of November last. Since then the patentee exhibited the "Renper" at the State Fair, held last August, at Sacramento, also at the Sonoma County Fair, from which he received the first premiums at both fairs, with the highest encomiums for the inventor's skill. We need not remark that Mr. Tustin is also a practical farmer as well as an ingenious mechanic, and that he has overcome many defects prevalent in like farming utensils; one of these we may remark, is the dead weight of a man on the apron, which is thus entirely dispensed with. This Reaper and Mower has no side draught, hence requires less power to propel it through its course of work. Mr. Tustin has also inaugurated a new principle, namely, that of employing double knives, which receive their motion from the large power wheel, through gearing and cranks, as also the Self-raker, which is by far the most perfect arrangement yet in existence. The driver is conveniently situated on a double spring seat, and around him he has all the levers and clutches at his fingers ends; he can throw out of gear either of the knives, the raker, or stop the entire machine.

Mr. Tustin has made many trials, and in such manner as to test his machine with celebrated machinery of Atlantic manufacture: in every case the "Union Reaper" came out first best! We have seen many testimonials respecting this wonderful invention, but forbear giving them in this issue. In a few weeks we shall give a more detailed description thereof, when we shall present additional matter pertaining thereto.

Condensing and Non-Condensing Engines for Mining Purposes.

The Cornish method of unwatering mines by the use of large single-acting condensing engines, has been the subject of much able discussion, and has frequently been determined to be unapproachable in its economic results. We will not, therefore, venture to question what has been so often decided by higher authorities, but take a view of the subject which, although it has not formed part of the scientific enquiry, is, nevertheless, important to the owners and managers of mining properties. It is fully admitted that a single-acting Cornish engine is capable of raising more water from a given depth, with an unit of coal, than any other known machine, but this is only one portion of the question which mine managers have to consider, in order to determine the kind of machinery they will employ. The whole question then becomes, By what means can we give a mine a fair trial in the shortest time and with the smallest possible outlay? We believe that, by the use of comparatively small high-pressure non-condensing engines and double-acting pumps, this object may be frequently effected.

The cost of a large Cornish engine, with pit-work, will, necessarily, be considerable; and it is, therefore, a matter of

J. TUSTIN'S REAPER, MOWER AND SELF-RAKER.

some importance to determine whether a condensing or non-condensing engine shall be used, since in many cases it amounts to deciding whether the property can be proved at a small instead of a large expense; and it not unfrequently happens that a promising piece of ground is allowed to remain untried, on account of the assumed necessity for a large outlay of capital. The great advantage of a non-condensing engine is, that the required power can often be obtained in a tenth of the space and at a tithe of the cost of a similar power in the single-acting condensing engine.

EXTRAORDINARY PHENOMENA.—In the course of this storm there have occurred several very singular incidents, reminding us of the stories often told of "the bursting of rain clouds." Some men at work on Saw Mill Flat, in a little ravine, were suddenly surprised by a rush down of a great body of water, as if a reservoir had burst above it; which carried away everything before it; yet there was no reservoir above nor any place where an accumulation of water could be made. The same thing happened, Thursday-week last in a little ravine east of Knickerbocker Flat. And again, in a ravine near Yankee Hill a company of miners were surprised with a tremendous rush of waters coming suddenly down upon them, from a little hill above, carrying away shingles, tools, etc., etc. No apparent cause can be found to account for such an occurrence, and no place above could be found where water could be dammed up or retained.—*Columbia Courier.*

The Mount Diablo coal mines has been damaged more or less, by a land slide taking place in that vicinity. The late storm has done great damage to the roads, and that in particular leading to Black Diamond.

Staging now adays is far more dangerous than traveling used to be on the "raging canawl". The chap that would take in sail by "knocking down a horse" now would be apt to float down the creek.

VIRGINIA CITY LIBRARY AND SCIENTIFIC ASSOCIATION.—A meeting of this Society was held last evening, at which we had the pleasure of being present. Most of the time was consumed in perfecting the organization, which is now completed, and the books will be open for membership next week. Men of ability and energy have taken hold of the movement, and comprehensive plan of organization. We were pleased with the extreme decorum and persision with which the proceedings were conducted, Mr. Collins discharging the duties of chairman in an able and dignified manner. After the meeting had adjourned, Mr. Davenport gave a dramatic rendering, exhibiting rare conception of character and power of expression. All of our citizens should feel interested in the prosperity of this Association, and we hope to be able at an early day, to lay before our readers the constitution and By-Laws, that they may judge of the necessity of encouraging it.

QUICKSILVER.—Owing to the re-opening of the New Almaden Mine, the quicksilver yield for California was vastly increased. The product from these mines and from the New Idria, Enriquita and Guadalupe, amounted to 45,023 flasks of seventy-five pounds each, of which 35,935 flasks were exported. The value of that export was \$1,079,850.

Importations for the quarter ending September 30th, under the tariff of March 1861, were about forty millions, of which twelve and a half millions were specie and bullion, being at the rate of one hundred and sixty millions per annum gross, or about one hundred and ten millions exclusive of specie.

HUMBOLDT MINES.—As an evidence of the richness of the rock found in the Humboldt silver mines, the Enterprise says that tons of it are being hauled to Virginia city for crushing, and that it pays well for the trouble. The distance is about two hundred miles.

Printing in Japan.

A Hongkong correspondent of the Boston Traveler, gives the following description of a Japanese printing office:

"I at once pushed ahead, and crossing the little stone-arched bridge which unites Desima with Nagasaki, I was soon in one of the principal streets, and opening a large closed gate in the high and massive wall on the street, stood in the spacious court before the printing establishment. How much in contrast the taste of the Pagan Japanese with that of the Dutch christians. Elegant shrubs and flowers adorn this court in front, while in the rear of the building rose tall pines and evergreen trees, which stretched their long verdant arms over the building, as if to adorn, protect and bless it. The structure itself is spacious, neat and even handsome, the roof being in the Chinese style of architecture in their temples, and covered with tiles, interlacing, and bidding defiance to water, while the floors of the two rooms of the office proper were covered with neat mats, and surrounded by sliding paper walls, while the ceiling is of wood handsomely painted.

The establishment belongs to the government, and is managed by the government, whose officials are seated as usual, on the floor, and doing little or nothing, since thirty days were to be spent according to usage, in silently mourning for the emperor, who had just deceased, during which time all public offices are closed and all public business suspended. Indeed, it was quite uncertain whether, during these circumstances, I could gain admittance. With the usual Japanese courtesy, however, the doors were opened, and I was freely and politely shown all the apartments and materials of the establishment.

On one side of the office was a hand-press of respectable size, and in good condition, while on the other side is a power press, moved by a wheel of large diameter, in perfect order, and of sufficient size to print the largest sheets usually struck off in the United States. The press was not in motion for the reason before given, and the rollers were suspended, and reams of paper piled up near the press, and the workmen hanging about idle, as if they were patiently waiting the expiration of the days of mourning to resume their labors. Besides these, there was another press, of the smallest dimensions, on which, when I made a second visit, some time after, two men were striking off two octavo pages of a new Japanese work, on natural history, the edition consisting of thirty copies. It was the enterprise of a young Japanese doctor, who had been instructed by a Dutch physician residing in the city.

Stands and cases were arranged as with us, one side of the office having the Roman type used in printing books and pamphlets in Dutch, and the other the Japanese; for types in the Japanese character are now cast in Holland, and have displaced the wooden blocks formerly used. The boxes for the Japanese letters were arranged on the same principle as with us, but in different order. The types, both Roman and Japanese, were nearly new.

Some of the paper used for printing is thick, white and close, and receives a fine impression. It is made neither of rags nor cotton, but of the bark of a tree, called the Paper mulberry, and is cheap as well as good. The printed sheets were hung over head to dry, just as with us. A dozen or twenty hands are employed at the case and the press, who appeared to be expert workmen, and were quite courteous. The establishment is managed entirely by Japanese, not a single Dutchman being admitted as a workman.

The Japanese are almost universally readers, having their schools established by law, and books for the use of the scholars and the people. Most of these books are small, and full of the most ludicrous illustrations, from which Punch must have borrowed many of his ideas, though inferior. Most of the books are of little value either in morals or science.

Arizona.

By Mr. R. Pumpelly—continued from our last.

These have been but little worked, although three attempts have been made—twice by the Mexicans and recently by the Santa Rita company, but in each case the Apaches have forced an abandonment.

The ores reduced by the last company were divided by hand separation into two classes. The first containing tetrahedrite in quartz and brown spar, had an average yield of one hundred and seventy-six ounces of silver to the ton. The second class, a quartz lead ore with little tetrahedrite, averaged eighty-one ounces to the ton.

CAHUABI MINES.—Westward of the Baboquiveri range, on the outskirts of the desert, in the country clothed with only bushy mesquite and cacti, and almost destitute of water, there exists a region, which from the character of its veins, appears to contain greater mineral wealth than any other part of Arizona yet explored. It is situated in the center of a large plain, forming part of the Papagoria, and about eighty miles by trail northwest of Tubac.

The veins which I observed occur in a quartziferous porphyry, and in an amygdaloid rock. This latter has a brown compact case, containing numerous acicular crystals of triclinic feldspar, and calcareous spar in impregnations and small threads. Cavities, sometimes filled with quartz and others with Delessite are frequent. In this formation is the Cahuabi vein. It is from twelve to fifteen inches thick, and con-

sists of quartz and heavy spar, containing argentiferous copper-glance galena and black tetrahedrite. The ore of this vein is said to average from one hundred and fifty to two hundred dollars a ton.

The Tajo vein, about three miles from the Cahuabi, occurs in the same rock, and is about two feet in thickness. The gangue is barytes and quartz. The ore consists of copper-glance, galena and tetrahedrite with some blende. With the copper-glance is associated copper pyrites. This vein contains also considerable metallic gold. The ore is said to vary from one hundred and fifty to one hundred and seventy dollars per ton.

Four miles west of the Tajo is a vein which traverses a quartziferous porphyry of the same character as that which bears the gold-quartz veins of Arivaca. The gangue is quartz, and contains black tetrahedrite and some vitreous copper.

A great number of veins of quartz and barytes occur in these two formations, the latter seeming to preter the amygdaloid rock. One vein of barytes, containing a "bonanza" of sulphuret of silver, was found and worked by the Mexicans, and several specimens of heavy spar associated with silver-glance from various localities were shown me.

SAN PEDRO MINES.—These are thirty-five miles east of Fort Buchanan, and were opened by a St. Louis company. The ores that I have seen from this locality are tetrahedrite and massive copper-glance, containing copper pyrites, with quartz and barytes for gangue from the San Pedro vein, and galena with iron pyrites from the St. Paul mine.

These veins are being opened and promising well, when the company abandoned them on the account of the assassination of the employees by the Peons.

The San Pedro river near those mines is said to be capable of furnishing sufficient water power for extensive reduction works. From a study of the fissure silver veins of central Arizona, it would appear—firstly, that they have in common, quartz, galena and tetrahedrite; secondly that there is a close connection between barytes and copper-glance, more or less argentiferous, in their occurrence in a vein; and thirdly, that the proportion of silver in the galena is largely increased when this mineral is associated with tetrahedrite. A large number of assays made on the gray copper ores of different mines showed a range of from one to eight and a half per cent. of silver. In many, if not all the richer varieties examined, a large percentage was undoubtedly contained as mechanically mixed sulphuret of silver.

In the Santa Cruz mountains, south of Fort Buchanan, is a series of lead mines, several of which were excavated by Mexicans several years since. They appear to follow the line of contact between an argillaceous limestone, in corals have been found, and a probable metamorphic porphyry. In places the deposits are of considerable extent, often many yards in thickness, but apparently, very irregularly developed. Near the surface the galena is often entirely changed into carbonate of lead associated with porous quartz.

At the Patagonia mine the ore consists of galena sufficiently altered, at the present depth of working, to render its reduction extremely simple. The average yield of silver from this ore has been, thus far about eighty dollars per ton.

There is another class of contact veins bearing both lead and copper ores.

To this class belongs the deposit near San Xavier on the Santa Cruz. The ore is galena with copper pyrites and tile ore, associated with oxyd of iron and quartz, the whole interstratified with metamorphic limestone. The galena examined contained 0.20 per cent., the copper pyrites 0.25 per cent., and the tile ore 0.10 per cent. silver.

Near Caborca, in northwestern Sonora, are deposits of a somewhat similar character. The strata of metamorphic limestone are almost vertical, and near their contact with granite become highly impregnated with lime garnets. Along the line of contacts, between the two formations, the presence of copper ores is indicated by frequent occurrence of green and blue carbonates and impure red oxyd. These indications often lead to the discovery of limited deposits containing a few hundred tons of copper.

One of these, worked in 1861, yielded from two hundred and fifty to three hundred tons of twenty-five per cent. ore.

There was no vein; the ore which was accompanied by calcareous spar, being gradually replaced at the bottom of the deposit by the limestone of the formation.

The ore is copper-glance, tile ore, or impure red oxyd, and some copper pyrites. Accompanying these deposits, and also where no copper ore is visible, the line of contacts occupied by masses of magnetic iron. Where the same limestone comes in contact with diorite, the former contains large crystals of magnetic iron and spinel.

PLANCHAS DE LA PLATA.—In Sonora, just south of the line, and near the meridian of Tubac, are the Planchas de la Plata mines, still celebrated throughout the Republic. According to the Mexican and Jesuit authorities, large masses of native silver were discovered there in 1769. Pieces of great size were obtained, one is said to have weighed 3,600 pounds, and the workings were being prosecuted with vigor and success, when the Spanish government declared the deposit to be a criadero, and as such to belong to the crown.

The place was therefore abandoned, and every attempt

mads at regular working since the revolution has been frustrated by the Apaches.

The most singular feature connected with the discovery is, that no vein from which these masses could have come, was found. The deposit seems to have been a regular placer. The silver occurred in pieces of every size down to small grains. Several rich veins were opened in the neighboring mountains, but were also abandoned from absence of protection. The only specimens that I have seen from this locality were apparently a partially decomposed quartziferous porphyry, from the wall rock of the Mina Colorada, and were impregnated with grains of silver-glance.

GENERAL CONCLUSIONS.—Before the working of mines in Arizona can become regular and profitable, many changes will be necessary. The Apaches must either be exterminated or reduced to complete submission, and this can only be accomplished by a long series of campaigns. A port is also necessary, without which all supplies and machinery have to be transported over deserts from the Gulf of Mexico or the Colorado river. Guaymas three hundred and fifty miles, and Port Lohos, one hundred and fifty miles from Tubac, are the natural enterances to the country, and so long as these remain in the hands of a treacherous and capricious government, no enterprise can flourish either in Arizona or Sonora. Further, the present unnatural boundary line will always be a source of trouble, affording a shelter to the robbers and assassins of both countries.

The substitution of white for peon labor, would probably be a failure, owing to the debilitating influence which the climate exerts on northerners. The Mexican labor is good when properly superintended; but to render it advantageous the recognition of the traditional custom of peonage is necessary. A thorough code of mining laws is also much to be desired, for however well the plan of permitting miners to make their own regulations may be thought to work in gold districts, it will never place silver mining on a solid basis; but cannot, on the contrary, act otherwise than prejudicially to the interests of both the miners and the State.

There is little doubt that after a few years of proper development, Arizona might become an important source of silver, although its veins do not possess the great thickness of many of the mines of Mexico, although the average richness of the ore is greater and more concentrated. Still it cannot be expected to produce the brilliant results obtained in Central Mexico.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR: VOLUME IV.—NEW SERIES:

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 50

Names can be sent in at different times and from different Post-offices

Specimen copies will be sent gratis to any part of the country.

streets, San Francisco.

Mining Companies and Associations.

Office Gould & Curry Silver Mining Company.—November 5th, 1861. Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the sixth day of December next.

JAS. C. L. WAINSWORTH, Secretary.

Office of the Gold and Silver Mining Company, San Francisco, October 19th, 1861.—Notice is hereby given, that at a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one half of which was made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.

C. S. HIGGINS, Secretary.

Office Bullion Gold and Silver Mining Company, Van Horn District, 305 Montgomery street, San Francisco. Notice is hereby given that the regular annual meeting for the election of officers for the ensuing year will be held at the company's office on the first Monday in December next, at 2 o'clock P. M.

T. L. HUBBINS, Sec'y.

Notice.—There will be a meeting of the Siles Gold and Silver Mining company, on Sunday, November 17th, 1861, at 11 o'clock A. M., at the house of M. H. Bryan, Virginia City.

A punctual attendance is requested, as business of importance will come before the meeting.

no 29

M. H. RRYAN, Sec'y.

Gold Hill Tenney Co.—The meeting called for Saturday, November 9th, is postponed till Thursday, November 14th, 1861. The meeting will be held at the saloon of Webb & Coppers, Gold Hill.

A punctual attendance is requested, as business of importance will come before the meeting.

ROBERT APPLE, Sec'y.

Shareholders of the Caledonia Gold and Silver Mining Company are hereby notified that a meeting of the Trustees in Gold Hill, on the 4th inst., an assessment of twelve and one half cents per share was levied on the capital stock of said company, payable on or before the 20th inst., to the Superintendent, at his office in Gold Hill, or to W. M. AGARD, San Francisco.

Shareholders failing to pay said assessment at the time required are hereby notified that so much of their respective interests in said company as will be sufficient to pay their several delinquencies, will be sold at public auction in front of the office of Wells, Fargo and company at Gold Hill, on the 9th day of December next.

By order of the Board of Trustees,
Gold Hill, Nov. 4th, 1861.

POSTPONEMENT OF SALE.—The sale of mining ground, at Silver City, by the Kansas Mining company, is postponed until four o'clock P. M., Tuesday, Nov. 19th, 1861. Sale to take place on the grounds of the company. Delinquents will please take notice and "come to time."

By order of the Board of Trustees.

R. C. CHAPPELL, Sec'y.

Virginia city, Nov. 9th, 1861.

Office Chollar Silver Mining Company, 612 Front street, San Francisco, Nov. 20th, 1861.—The annual meeting of the Stockholders of this Company will be held at their office in this city, WEDNESDAY, December 4th, 1861, at 11 o'clock A. M.

nv 23

W. E. DEAN,
Sec'y Chollar S. M. Co.

GOLDEN GATE COMPANY, GOLD HILL DISTRICT.—A meeting of the shareholders in the above named company will be held at the office of H. O. Gaylord, in Virginia on Saturday, Nov. 15th, at 7 P. M.

By order.

T. A. MONKHUSE, Sec'y.

Members of the Senator company, Congress Ledge, Devil's Gate District, are hereby notified that an assessment of twenty-five cents per foot was this day levied by the Board of Directors, payable to the Secretary at his office, in Virginia, on or before the 15th day of November, instant.

L. W. FERRIS, Sec'y.

Office of the Cole Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Cole Silver Mining company held Oct. 25th, 1861, an assessment was levied of one-tenth of one per cent on the capital stock of the company, held fifty cents per share, payable within thirty-five days to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.

By order of the Board of Trustees.

J. B. COFFIN, Sec'y.

Office Dias Padre Gold and Silver Mining Company, 215 Front street San Francisco, October 29th, 1861.—A meeting of the stockholders of the Dias Padre Gold and Silver Mining company, he held at the office of the company, on Saturday, November 16th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting. By order of the Board of Trustees.

JOS. P. NOURSE, Secretary.

Office Rogers' Silver Mining Company, San Francisco, October 16th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 15th day of November, 1861, at the office of the company, in this city.

By order of the Board of Trustees.

JOEL F. LIGHTNER, Secretary.

Office of the Sucker Gold and Silver Mining Company, Nos. 1 and 2, Montgomery Block, San Francisco, California.—Notice is hereby given that the annual meeting of the Stockholders of the Sucker Gold and Silver Mining Co., will be held at the office of the Company, Nos. 1 and 2 Montgomery Block, on the first Monday after the first Tuesday of January, A. D. 1862, at ten o'clock A. M. of that day, for the election of Trustees, and for the transaction of other business.

By order of the Trustees.

R. H. WALLER, Secretary.

Notice is hereby given to the members of the Arizona company, that there will be a meeting of said company held at the Recorder's office, in Virginia city, N. T., on Saturday the 23rd inst., for the purpose of organizing said company. All delinquents are notified that unless their assessments are paid by said date, their interest in said company's claims will be sold to pay the same.

R. T. SMITH,
President Arizona Company.

Office of the Desert Mining company, 500 Montgomery street, San Francisco, Nov. 23d, 1861.—The stockholders are hereby notified that an assessment of one dollar per share on the capital stock of the Desert Mining company, has this day been levied, payable on or before the 28th day of Dec. next, at the office as above.

By order of the Board of Trustees.

J. H. LYON, Sec'y.

Notice.—The regular annual meeting of the stockholders of the Cedar Hill Tunnel and Mining Company, will be held at the office of the Secretary, on Thursday, January 24, 1862, at 7 o'clock P. M., for the election of officers for the ensuing year, and such other business as may come before the meeting.

San Francisco, December 24, 1861.

C. L. FARRINGTON, Sec'y.

Office of the (Ruas District) Union Gold and Silver Mining company, San Francisco, Dec. 13th, 1861.—The stockholders are hereby notified that an assessment of ten cents per share on the capital stock of the Union Gold and Silver Mining company was levied on the 12th inst., payable on or before the 15th of January, 1862, at the office of the company, 410 Montgomery street.

By order of the Board.

C. J. HIGGINS, Sec'y.

Notice is hereby given that an assessment of One Dollar per foot (share) has this day been levied on the ground at the Alhambra Mining company, payable at the office of the company, 815 Sansome street, San Francisco.

By order of the Trustees.

J. O. STRAUCH, Secretary.

November 24th, 1861.

Office Ophir Silver Mining Company, San Francisco, Nov. 26th, 1861.—The Annual meeting of the Stockholders of this company will be held at their office in San Francisco, on Wednesday, December 11, 1861, at 11 o'clock, A. M., for the election of officers for the ensuing year, and transactions of such other business as may be presented.

JAS. W. WHITE, Sec'y

ADRIATIC CO.

POSTPONEMENT OF SALE.—Delinquent stockholders are hereby notified that the sale of delinquent stock advertised to be sold on November 10th, has been postponed until Thursday the 21st inst., at which time all delinquent stock will positively be sold in front of the Secretary's office, at 1 P. M.

By order of the Board of Trustees.

JOHN G. GILCHRIST, Sec'y.

Virginia city, November 10th, 1861.

A MEETING of the shareholders of the Summit company will be held at the Gold Hill Bakery, in Gold Hill, on Friday, Nov. 15th, at 10 o'clock P. M. Punctual attendance of the shareholders is requested, as business of importance will be transacted. By order of the President.

JOHN DOHLE

SAVAGE Gold and Silver Mining company. A meeting of the stockholders in the above company will be held at 10 o'clock, A. M., the 17th day of December 1861, at the office of Lent, Sherwood & Co., in this city, for the transaction of important business. Parties claiming an interest in the above company will please hand in an abstract of their title either to Robert Morrow at Virginia city, to A. K. Head Nevada, or the undersigned before the 14th day of December next.

San Francisco, November 27, 1861.

WM. M. LENT, President.

Office Crown Point Gold and Silver Mining company, 321 Front street, San Francisco, Oct. 28th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees, will be held at the office of the company, on Wednesday, November 20th, at one o'clock P. M.

O. B. CRARY, President.

Office Crown Point Gold and Silver Mining Company, 321 Front street San Francisco, Nov. 6, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining company has this day been levied, payable on or before the 10th of December next, at the office, as above.

J. H. JONES, Sec'y.

Office Sierra Nevada Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 28th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City; or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees of S. N. S. M. Co.

J. H. BREWER, Secretary

Office of the Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that all stocks on which assessments are now due, according to the laws of California and the By-Laws of the company.

All parties holding stock of this company are requested to hand it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees.

JOSH. S. HENSHAW, Sec'y.

Office of Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty sixty or ninety days from date, to the Treasurer of the company.

By order of the Board of Trustees.

JOSH. S. HENSHAW.

Notice.—A general meeting of stockholders, of the New Idria Mining Company will be held at the offices of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.

By order of the Board of Trustees.

HENRY S. HUDSON, Sec'y.

San Francisco, Nov. 8, 1861.

Notice.—The annual meeting of the Charles Cany mining company, will be held at the office of the company (D. Davidson's room, northeast corner of California and Montgomery street, San Francisco) on Friday Dec. 27th, A. D. 1861, at 3 o'clock P. M. of that day, for the election of officers for the ensuing year, and transaction of such other business as may be presented. A punctual attendance of all stockholders is requested.

By order of the Board.

ALEX. FLY, President.

Office of Sucker Gold and Silver Mining company.—Notice is hereby given that the Board of Trustees of this company (formerly the Sucker company, Gold Hill District) have this day, Tuesday, Nov. 19, 1861, duly levied an assessment of fifty cents upon each share or foot of the capital stock, of or ownership in, said company, payable immediately to the Secretary, at their office, Nos. 1 and 2 Montgomery Block, San Francisco, or J. A. Hohert, Trustee at Gold Hill, Nevada Territory. On default of payment of which assessment for thirty days after publication of this notice, all delinquent stock and ownership will be sold according to law, and the rules and By-laws of the company.

R. H. WALLER, Sec'y.

Notice.—Notice is hereby given, that Jos. J. DuPrat is the only authorized agent in California, U. S. of America, for the silver mines known as "Mina Rica," "Guasaba," "Fortune," "Santa Cruz," and "Nacimiento," situated near San Antonio, Lower California, Mexico.

CHAS. J. DUPRAT,
EM. LEVA,
DUPRAT, SCHMITZ & CO.,
CHAS. KRAFT & CO.,

La Paz, Lower California, July 30th, 1861.

For the purposes of reference, the Deeds of the above named mines have been recorded in the city and county of San Francisco, State of California.

For further particulars respecting the above named mines, inquire of

JOS. J. DUPRAT,
423 Washington street.

Office of the Bullion Gold and Silver Mining Company, 410 Montgomery street, San Francisco, Jan. 13, 1862.—Notice is hereby given that at a meeting of the Board of Directors, held on the 11th inst., an assessment of two cents per share was levied on the capital stock of this company, one half of which is called forthwith.

By order of said Board.

C. S. HIGGINS, Sec'y.

Office Cedar Hill Tunnel Mining company, No. 609 Sacramento street. An assessment of Two hundred and fifty dollars per (original) share has been levied by the Trustees, payable as follows: Twenty per cent. on the 15th of January, and twenty per cent. on the first of each month following until paid in full.

San Francisco January 14, 1862

CHAS. L. FARRINGTON, Sec'y.

Office of the Falls of Clyde Consolidation Gold and Silver Mining Company, New No. 534 Washington street, San Francisco, January 3rd, 1862.—At a meeting of the Board of Trustees of the Falls of Clyde Consolidation Gold and Silver Mining Company, held January 3rd, 1862, an assessment of one eighth of one cent, on the capital stock of the company—being twelve and one half cents per share—was levied, payable within thirty days from this date, at the office of the company in this city.

W. L. DUNCAN Sec'y.

Shareholders of the Osceola Gold and Silver Mining company are hereby notified that the meeting of the Trustees of said company in Virginia city, on the 2nd inst., an assessment of twenty cents a share was levied on the capital stock of said company, payable on or before the 20th instant to the Treasurer, at his office in Gold Hill, or to D. H. Russell, Virginia city.

Shareholders failing to pay the assessment at the time required, are hereby notified that so much of their interest in said company as will be sufficient to pay the amount of their delinquencies will be sold at public auction, in front of the saloon of Lindington & Russell, in Virginia city, on Saturday, the 10th day of December next, between the hours of twelve and three P. M.

J. S. WATKINS, Treasurer, Osceola G. & S. M. Co.
Virginia city, Nov. 2, 1861.

Notice to Quartz Miners.

The Union Gold and Silver Mining company having opened their mineral lodes in the Buva District to an extent satisfying them of its value of the same, and having contracted for the erection of a quartz mill near said lodes (not exceeding five miles distant) are now desirous to contract with responsible parties for mining and delivering at an early day, at the said mill, not less than one thousand tons of quartz rock. Proposals will be received until the fourteen day of February next. For further particulars enquire at the office of the company, 410 Montgomery street, San Francisco.

C. S. HIGGINS, Sec'y.

Office North Potosi Silver Mining Company.—Notice is hereby given, that the Trustees of the North Potosi Silver Mining company, have, this sixth day of January, 1862, levied an assessment of one dollar per share upon each and every share of the capital stock of said company, payable on or before the fifteen day of February, 1862, to H. A. Eastman, at Virginia City, or the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees.

J. H. BREWER, Sec'y.

Office of the Combustion Gold and Silver Mining Company, 410 Montgomery street, San Francisco, Jan. 13th, 1862.—Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th inst., an assessment of ten cents per share was levied on the capital stock of this company, one half of which, together with three cents per share (remainder of an eight cent per share assessment levied July 26, 1861) is called forthwith.

By order of the Board.

C. S. HIGGINS, Sec'y.

ROYAL HOTEL.

VICTORIA, V. L.

JAMES WILCOX PROPRIETOR.

THE ABOVE HOTEL is conducted on the most improved principles; is situated on Wharf street; of easy access to all new arrivals, being in the immediate neighborhood of the wharves. The proprietor begs to inform the miners of California and traveling public, who intend to visit Victoria, that he has superior accommodations for single and married persons, or families, with or without board.

Guests entertained at the following rates: Board per week six dollars. Board and Lodgings, \$8; Board per day, \$1; Lodgings 60 cents. The Bar is furnished with Wines, Spirits, Malt Liquors, Cigars &c., all of the best quality.

N. B.—The Building is Fireproof.

Ja30

SPECIAL NOTICE.

HIGHLY IMPORTANT INVENTION IN DENTISTRY.—Dr. D. STEINBERG begs leave to announce to the citizens of this city, that letters patent for his invaluable improvements in mechanical Dentistry were granted him on the 12th of November last.

This invention consists in the application of GUM ENAMEL to gold plates for artificial teeth, and are acknowledged to surpass all others in use, for their beauty, style and exactitude of fit; their weight compared with others, is less but are far more durable by the addition of the gum enamel. Specimens of this valuable invention may be seen and examined at the dental office of the undersigned, No. 648 Washington street, near Kearny. Great care and attention is devoted to the perfect filling of teeth. Teeth extracted by the benumbing process.

STEINBERG & SICHTEL,
Practical Dentists,
648 Washington st., near Kearny.

MASSEY & YUNG.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....FEB. 8, 1862.

The MINING AND SCIENTIFIC PRESS published is at 522 Merchant bet. Montgomery and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOE WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

REMOVAL OF THE "PRESS" AND PATENT AGENCY.

The business of this office having become quite extensive, it therefore made it incumbent upon us to remove from our offices in the Government House, where we had scarcely room enough to do our regular office business. We occupied said premises for nearly two years, and were really loth to leave them. Circumstances have placed us so that we now can enjoy separate offices for the printing of our MINING AND SCIENTIFIC PRESS; and the applicants for letters patent need no longer be interrupted by the thousand and one inquiries heretofore made, while we occupied said offices.

We have moved our printing rooms to Merchant street, No. 522, between Sansome and Montgomery up stairs, and the

PACIFIC PATENT AGENCY

and the Editorial rooms are now eligibly situated in the former U. S. Court Building, northeast corner of Battery and Washington streets, in room 24. All persons having business with us will favor us with a visit as early as convenient. Letters will be addressed to us in accordance with the above.

The Washoe Directory.

We have been permitted to look over the advanced sheets of a directory for the Territory of Nevada, now in course of publication in this city. The work is being gotten out by Mr. J. W. Kelly, who has canvassed the Territory in person, collecting the matter for this book with great care, and from the most authentic sources; it therefore cannot fail to be of essential service to business men, as well as of general interest to the reading public. It contains a graphic sketch

of the early history of the Eastern Slope—a very full description of the various mills, reduction works, and other industrial establishments; the founding of towns, building of roads, mineral explorations, character of leading mines, &c.,—a list of public officers, county boundaries, and table of distances, being, in short, an epitome of all that is most curious and useful, in the wonderful region now opening on our border.

In the body of the work the several counties, of which there are nine in the Territory, are taken up and separately treated of. From the remarks on Lyon and Churchill counties, united for judicial purposes, and considered in connection, we make the following extract, from which it will be seen the history of the country, though dating back but a few years, is not without interest. Speaking of the early mining operations, the writer observes:

"The Devil's Gate district, adjacent to Silver city, was the second—Virginia being the first ever created in the Territory. In nearly every direction about Silver city, for a distance of several miles, quartz leads rich in gold and silver are met with—the ground of the Daney company, in the southern part of the district, and near Carson river, being by far the most valuable. The rock taken from this claim is equal in richness to any ever found in the country. The ledge is not so wide as some portions of Gold Hill, this running from ten to fifty feet, while the Daney varies from twelve to thirty feet. The latter, however, having had the benefit of scientific engineering from the outset, is in the best possible condition, both as regards security and facility for raising the ores. It is moreover convenient to extensive water power, which, by cheapening the cost of reduction will, with its other advantages, be more than an offset to the somewhat greater size of the claims at Gold Hill.

The Daney grounds are distant about five miles from Gold Hill, yet as the rock obtained at the two localities is precisely alike, and it is in range with the supposed direction of the Comstock lead, there is no longer any question as to its forming a part of the same.

Placer diggings were worked in Lyon county as early as 1849, having been found by the immigrants that year, at Chinatown, now Daytown. Here and along Gold Cañon the bars paid as high as an ounce a day to the haad, for a year or two at first, and fair wages for several years after. Even so late as the summer of '59, these localities, as well as Six Mile Cañon, continued to be worked, though paying rather slender wages. At Chinatown too, the first house built, east of the present site of Carson city, was put up, having been built by James McMarlin, and his brother John, in the fall of '49. This was the old log building still standing, and at one time used by Major Ormsby, and afterwards by Keller as a store. John McMarlin, together with a companion named John Williams, was killed by the Indians, while packing in from California in '58. This occurred on the west summit, about one mile above Slippery Ford Hill, and was the work of some renegades, who had been outlawed by their own people. The grave of Williams may be seen in a beautiful grove of pines, on a little flat near the road. McMarlin was taken home and buried in Carson Valley, on the farm, where his brother now resides.

At no other points were placer diggings found, though two brothers, Allen and Hosea Grosh, came over the Sierra, and engaged in prospecting for silver in the vicinity of Gold Cañon, as early as '55. How they got the idea that this metal existed there is not apparent, since they never communicated the fact to any one so far as known. Being of a reserved turn of mind, they revealed but little of their thoughts on the subject to their associates—the latter not being of a class mixed with that thirst for knowledge, which leads them to be inquisitive on abstract questions. Hence, although these men were constantly engaged collecting rock, and testing it for silver, they were suffered to think their own thoughts, and to pursue their vocations unquestioned and unheeded; and both they and their labors would before this have been forgotten, but for the subsequent finding of the metal they were in search of so near the scene of their operations, and of which they would themselves have been the discoverers, in all likelihood, but for an accident that brought their work to a sad and summary termination. In '57, after they had been prosecuting their researches nearly two years, Hosea Grosh while at work with a pick, struck the instrument into his foot, causing a severe wound, from which lock-jaw ensuing, he died soon after.

At that time, Comstock, who afterwards gave his name to the celebrated silver lode, had a cabin near by, to which the young man was carried, and where the owner attended him with his characteristic kindness. This cabin was situated a little below where Silver City now stands, and so late as '59 a little mound was to be seen a few rods up the hill on the southside of Gold Cañon, marking the spot where poor Grosh had been buried.

The surviving brother, pining over his loss, became disheartened, and returning to California, himself, soon after, sickened and died. Whatever of human purpose had existed for seeking silver in the Washoe region, perished with these men, leaving its existence to be disclosed, as has been the case in most notable discoveries of this kind, by the agency of chance, as we have said. How these brothers came to get the impression, that there was silver in this region, remains a mystery; they might have derived it from conversation about the geological features of the country with those who passed through it, or from those vague traditions, which have ever assigned to the belt of which this forms a part, a strange and marvelous wealth; however this may be certain it is, they had well grounded notions on the subject and came very near attaining the great aim of their hopes and toils, as will appear from the following circumstance: During the summer of '59, and but a few weeks after this discovery of the Comstock ledge, H. Degroot, who has since made himself familiar with nearly every locality within the rein of the Great Basin, while examining the mountain ranges that skirt Gold Cañon, came upon a shaft, sunk in a lofty bench of Grizzly Hill, at the mouth of American Ravine. As the work had evidently been done a long time before, his curiosity was excited to learn something of its history. Examining it more closely he found that it had been filled up by placing logs and boughs across it near the top, on which earth had been thrown, as if with the design of concealing its real depth, which was afterwards found to be about forty feet. On inquiry, he learned that this was the work of the Grosh brothers, who had been two years before actually taking out argentiferous rock, reducing it in a rude furnace whose remains stood on a spot within three miles of the present Ophir claim, where the great mother lead was afterwards laid open, and in a direct line with the Daney ground, now known to be a portion of that lead; so nearly did these ill-faring but well-deserving men-dreamers, in that day, seers in this, attain to fame and fortune, in becoming the finders of the great Comstock ledge! None of the old residents seemed to be aware of the existence of this shaft, though they knew these men had been working near the spot some two years before. It is a curious circumstance that this excavation having been re-opened in 1860, the remains of a female were found at the bottom of it, but whether of a white or Indian, or how they came there no one could tell. The opening now goes by the name of the lost shaft.

There are other reminiscences connected with the early history of the country embraced within the borders of these two counties—Churchill being of vast extent and reaching to the eastern boundary of the Territory. Here, at a point on Carson River, thirty miles below Chinatown, was the scene of the Williams massacre, which led to the Indian war in the Spring of '60—resulting so disastrously to the whites and so injuriously to the country. Here belongs, in good part, a narration of the sufferings of the early immigrants, and the exploits of the trappers who first pushed their way over the Rocky Mountains, while many a legend and tale of heroism might be told of the Indian tribes who formerly made this their home, yet all this must be for the present foregone, since matters of more immediate utility press upon our eyes.

As has been stated, several mining districts containing numerous rich quartz veins, have been laid out in this region. Of these ledges a good many are worthy of mention, because of their manifest value, the extent to which they have been opened, or some other circumstance tending to give them notoriety. Of all this number the now celebrated Daney Ledge stands first, being of immense value, and by many—all its advantages considered—accounted the most desirable piece of mining property in the Territory. In the Devil's Gate, as well as the Flowery District, a portion of which lies in this region, a number of ledges are now being worked with profit; while a very rich tract of argentiferous country is known to exist at Silver Hill, a mining locality discovered in the spring of '61, a few miles east of the Carson Sink.

But what forms the mineral feature of this entire section of country, after mentioning the Daney Ledge, is the Coal Field discovered by Col. Whitman in the Butte Mining District, a few miles east of Chinatown. At this point a vein of very superior bituminous coal was found in August last, and which subsequent examination has proved to be of considerable magnitude. From the discovery claims, owned by Col. Whitman, a large quantity of coal has been raised, and the article is now being used for making steam in the mills on Gold Cañon, besides being extensively employed for blacksmithing and other purposes at Virginia City, among which may be specified that of generating gas for the works at that place. The Whitman claim is at present considered the most valuable of a large number located, from the fact alone of its having been more thoroughly opened. Since, some eight or ten other claims to the north and west of this, show equally good surface indications, and have proved quite as rich so far as prospected. With this coal to work the metalliferous veins now known to exist in the surrounding districts, the entire mining interest of the country is estimated by those versed in metallurgical pursuits, to have been appreciated from fifty to one hundred

per cent. Indeed without a supply of fuel from some such source, the productive wealth of the mines would have been comparatively limited, being restricted to the capacity of the mills now in operation. With this coal, it is confidently believed these vast repositories of the precious metals may be worked with no other restriction than capital seem fit to impose, with success and profit for generations and centuries to come.

Semi-Annual Mint Exhibit.

On the 31st ult., the Braach Mint of this city closed for settlement. The following is the exhibit of the gross amount of business done for the six months previous:

The total amount of Gold Bullion, delivered and charged W. S. Denio, Melter and Refiner, from July 1, 1861 to Jan. 18, 1862, is, ozs.....	775,033:105	\$14,419,220 55
The amount returned and credited him during the same period, is, ozs.....	774,868:603	14,416,160 05
Showing actual wastage, ozs.....	164:502	3,060 50
Legal limit of wastage, ozs.....	1,550:066	28,828 44
The total amount of silver bullion delivered and charged W. S. Denio, Melter and Refiner, from July 1, 1861, to Jan. 1862, is, ozs.....	717,977:035	\$ 835,464 55
The amount returned and credited him during same period is, ozs.....	777,660:045	835,095 80
Showing actual wastage, ozs.....	316:090	368 75
Legal limit of wastage, ozs.....	1,435:095	1,670 92
The total amount of gold bullion, delivered and charged Wm. Schmolz, Coiner, from July 1, 1861, to Jan. 18, 1862 inclusive, as per books, is, ozs.....	778,887:057	\$14,490,931 53

Legal limit of wastage, ozs.....	1,210:099	1,409 15

RAIN IN TUOLUMNE.—Dr. Snell, of Sonora, a gentleman who has the reputation of making correct meteorological observations reports that from November 10th, 1861 to January 23d, 1862, 102 inches of rain had fallen—equal to 8 feet 6 inches of water spread over the entire country! During the period mentioned there were 69 rainy days.

Dr. D. Steinberg's Patent Dental Improvements.

Although each year brings us nearer to the perfections in the application of artificial teeth-plates, yet none have been presented thus far that can claim more merit than the following described process of Dr. Steinberg's improvement for setting artificial teeth, which in every respect supercedes the many devices already resorted to. The great advantages he possesses in his mode of applying and making such plates, renders the practice of dentistry to be prosecuted with less difficulties, labor, or expense to the operator, and his plates appear by far the most natural; and it is needless to remark that for strength and durability they cannot be excelled. The Doctor received a patent last year from our Government, and we have since made application to European Governments for securing patents, with some important additions and improvements. We are assured by the inventor that no misfit of the plates, however varied or peculiar they may be, need be feared. The plate need no longer undergo the arduous task of soldering, whereby the plate becomes warped or bent out of shape. But the most particular advantage it possesses is, that any and all kinds of teeth can be employed, and that the danger of oxidization from the metal plates is entirely averted, and of which we have had many sad accounts heretofore.

In figure 1, we show a sectional view of an upper set of teeth.

Figure 2 represents a side view of the same.

Fig. 3. Shows an under side view of an upper set of teeth and the manner of its construction.

Fig. 4. Illustrates the manner of setting the teeth, together with the position of the rubber or gum substances, a particular pasty substances which he employs, and when vulcanized appears the most natural of the human mouth.

W. BOHM'S IMPROVEMENTS ON BUCKLES &c.

We have just seen at the extensive Jewelry and Silver warerooms of Messrs. Braverman & Levy, No. 621 Washington Street, who are the agents for the patentee of a new and improved style, of constructing Ladies' Buckles, and similar precious ornaments. The many devices in enamel, brilliants, &c., have heretofore been made as represented in Fig. 1: that is, with a joint, having three or more prongs penetrating into the ribboa. The great improvements effected, may be summed up as follows. Mr. Bohm has succeeded in producing something not only beautiful and novel, but, more especially useful and practicable. As will be seen in Fig. 2, the usual rim is employed, and may be left flat or bent oval. Immediately in the centre, he provides the joint C (in fig 3) reaching across the buckle. To said joint, are attached three or more prongs, D D D. These, when closed in, are entirely hidden from sight by an ornamental strip of metal, (B.) as also the spring (E.) Fig. 4, represents a stationary cylinder, (immediately under the joint C) provided with three apertures, for allowing the prongs D to enter. On the side, and parallel with the rim of the buckle, may be observed a hook, or cross-bar; so that the

ribboa or material may be fastened securely. G shows another ornamental metallic plate, which is soldered transversely to the rim of the buckle, one side of which, has the necessary opening for the springs E, and catch A. Having now finished its mechanical construction, we may here remark; that considerable trouble and annoyance to the fair sex are dispensed with, since this ornament is much easier applied than the old style buckle, besides giving it greater durability and strength. The ornament is not liable to be bent out of shape, especially should the material be light. This buckle is easily adjusted, and nothing from the whole surface is hidden from view. The material, or ribbon, is not so soon worn out as with the old style buckle. In this buckle, the ribbon passes at once under the strip G; and one pull, will tighten it closely to the waist. The ladies of California we have no doubt, when they examine this new, and elegant ornament, will soon discard the old buckle for the new, we warrant. Messrs. Braverman and Levy, have quite an assortment of styles, both chased and enameled, and will take pleasure in showing their great utility and advantages.

Dr. D. STEINBERG'S PATENT DENTAL IMPROVEMENTS.

The extensive practice which Dr. Steinberg had in New York, induced him to bring his valuable invention before the public, and since his short career in this city, has completely revolutionized the mechanical dentistry department, since his work looks neater, fits better, and what is more than all, it is less expensive, and decidedly more durable than all others in use. Dr. Steinberg can be consulted at his office on Washington street, where he is associated with Dr. Sichel, on the above subject. See advertisement elsewhere.

FATAL MINING ACCIDENT.—A short time since, B. F. Lockman, of Shasta county, was killed by the caving of a bank, just as he was closing his day's work. A Chinaman in his employ was killed at the same time, the bank cutting him in two.

EASTERN MAIL.—A large amount of mail matter came in yesterday from the East, and two wagon loads have also been sent forward. The back mails will be sent in as soon as possible, and we may expect regular mails from both east and West.—*Silver Age.*

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miners Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 222 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, metallurgist, geologist and assayer together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 222 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treats of assaying. The first three chapters contain much valuable information, all of which has been published in reference and works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

A BOOK FOR THE MINES.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide," a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work. It is a neat duodecimo volume of 222 pages, profusely illustrated with engravings of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work is "The Miner's Companion and Guide," and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's treasured hidden treasures.—[Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths. fine.....3cts per oz.
" from 300-1000ths. to 750-1000ths fine. 7cts " "
" " 750-1000ths to 950-1000ths " 14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce 1/2 per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, 1/2 per ct. gross value of silver for making bars; also when gold is contained 1/2 per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. 1/2 per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. 1/2 per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. 1/2 per ct. gross value of deposit for making bars.

In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of 1/2 per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and he imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

PACIFIC FOUNDRY AND MACHINE SHOP. First Street, between Mission and Howard, San Francisco, California.—By recent additions to our extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp shoes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flaming Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Cur Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smut Mills; Roller Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.
Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GOLIAD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour ter arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and ye simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to an even surface.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- 12th. We invite Farmers wishing a machine to call and see before purchasing.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munu & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

(Directly opposite the Patent Office.)

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States

J. N. RISDON

MONS. LECLERC'S QUARTZ CRUSHER AND AMALGAMATOR.

In our last week's edition, we gave a notice of Mons. Leclerc's new method of amalgamation. We herewith present an illustration of his machine, for which we have made application for Letters Patent through the agency of this journal. M. Leclerc has demonstrated in our presence and to our satisfaction, that in less than two hours he will amalgamate from one two tons of ore. He employs one ingredient in the shape of a powder, (his secret) which completely desulphurizes the sulphur, and forms an auxilliary for impregnating the ore with the mercury. It will be seen in accompanying sketch that a hopper, in the neck of which is a grinding surface, prepares the ore finely powdered, thence dropping upon a perforating grinding plate, where the ore undergoes a still greater pulverization. To the centre shaft are fastened a number of bars or arms, upon which are secured a number of copper plates, the whole of which serve as mullers or stirrers. Into this vessel, containing the mullers the mercury, which is heated by means of steam, the ore is undergoing a most rapid amalgamation. An aperture is provided in the lower part of the vessel, through which the amalgam is allowed to pass; water, being introduced from the top, clearing the earthy substances from the surface of the amalgam, it is finally allowed to pass into a sluice with riffles, and here the amalgam is collected, thence going through the retorting process. M. Leclerc assures us he can work a fair paying ore to within five per cent. of the assay. He has formed a copartnership with Mr. Belden of this city for the sale of his machine and right of use of his process. The cost of the machinery is comparatively light, and requires little power to propel the same. The inventor claims that he has a deal of experience in treating ores indigenous to the Pacific coast, and he asserts his process is "ne plus ultra." "Seeing is believing"—he will demonstrate what he says his process is capable of, to those who are interested in mining operations. We have witnessed one experiment executed at our office, and can verify the facts above stated. For farther particulars address the editor of this journal, or Mr. Belden, on Washington street, near Battery.

California Legislature.

This body being in session in the same building in which we are situated, our facilities are excellent for knowing what is going on. It gives us pleasure to say that the present compares very favorably with former bodies. There may be less speaking talent existing in this Assembly than usual, which we consider however, is counterbalanced by the good business qualifications of many of the present members.

The business transacted so far amounts to but little: this was to be expected, and is usually the case, for it must be recollected that nearly all important matter first goes before the different committees, by which it is properly arranged for the subsequent action of the two Houses.

OREGON AND WASHINGTON TERRITORY.

A cotemporary remarks that the accounts which continue to reach us from the gold fields of the North are still of a glowing character, but in most cases the reports are not from those who are in the mines, but have been received second-hand at the Dalles, or some other of the numerous starting points. We have no doubt of the existence of good mines in that section, but whether the discoveries are of extent enough to give a fair field of operation for the immense emigration that will pour into them from every direction remains to be seen. Nor are the accounts received altogether of an encouraging character. In the Red Bluff Independent of the 10th, we find the following item:

"Frank Maguire arrived on the boat last Sunday, bailing from the new Nez Perce mines. He left this place on the third of July last, with a pack train, and left Yreka for the mines on the 20th of July. He reports that country a most desolate region, and the big strikes reported in the newspapers all a humbug, got up by speculators. The gold found is of an inferior quality, worth but twelve dollars and a bit an ounce. All kinds of eatables are up at starvation prices, and the country froze up and buried with snow. The mines would be a good thing if located anywhere within the bounds of creation of civilization, but being outside of the habitable world, Frank gives them rather a bilious character. Much suffering is anticipated the coming winter, as many are there without a cent or a mouthfull of grub, and in the midst of one of the severest winters ever experienced on this coast."

From the subjoined description it would seem that the mines on Salmon river are totally unlike any of the placers in this State.

Seventy-five miles, a little East of South from Elk City, is situated the Salmon river mines; not on the river as is generally supposed, but upon the top of a high rugged mountain, seventeen miles east of Salmon river. These mines are unlike any ever discovered on the Pacific coast. The top of the mountain, which is many thousand feet high, is level in its general appearance, with small knolls scattered over it. This flat is about three miles in diameter, and at the foot of these knolls are found sloughs or swampy looking places, covered with a green sod of mountain grass. These sloughs are not miry but quite solid, yet can be easily spaded and shoveled off. It is in these places that gold is found, and found in leads. The miners use no pick, but cut the sod with some sharp tool, and then spade or shovel the ground off. There are no rocks to interfere with working them; one hand will make per day with a rocker from fifty to five hundred dollars, and some have made even more than this last figure. They use nothing but the pan and rocker; there is but little water upon this mountain, no stream, but a little rivulet called Miller's creek, which has not over an inch of water as measured in California. The rock on the summit forms a basin, and there appears no outlet to it. The way the miners operate, is to dig holes in the ground and let the water fill into them, and after washing with pan or rocker they throw out the dirty water, and fresh comes in again. The whole of the ground containing these leads is taken up, not one inch vacant.

The gold obtained is of a poor quality, about twelve dollars per ounce; it is quartz gold and is about the size of rifle powder.

The country is a barren, bleak looking region. On this mountain they never have rain; it is so high that nothing but snow falls. There were about seven hundred men on this mountain last fall; some forty or fifty was going to try to winter there, for the purpose of taking care of their claims and holding them. The snow is not sufficiently off before the first of July to permit work. Mr. McMillen does not recommend men to go to these mines.

The Nez Perces are not rich, hard to work, and you cannot work more than four months in the year, while the Salmon mines, although the richest he has ever seen are not extensive, and what is of them are taken up.

The miners of this region expect a difficulty with the Indians in the spring; there is a rich and powerful tribe, some eleven or twelve hundred warriors, armed with English muskets and rifles, who are threatening the whites, and from whom there is great danger.

A correspondence in the Oregon "State Republican," from Oro Fino gives glowing accounts of the probable future of the Salmon river country, prophesying that an emigration of 40,000 people will come in there during the coming summer. The writer says that Lewiston, on Snake river is to be the entrepot for the mines, and concludes as follows:

The distance from Oro Fino and Lewiston to Salmon diggings, is about the same—say one hundred miles. The market in the mining region cannot be glutted at any time during the next summer. The rapid increase of population expected here during the next season, will more than excel the facilities we have for transportation. Teamsters and packers will make more money than the merchants. Their pay is always cash, whereas the merchant will trust the miner, more or less, who is seldom permanent, but ever ready for a move, whenever any excitement springs up at a distance, of better diggings than those he is operating in, and is not particular whether the bill is paid before leaving or not. Every merchant in this place has suffered more or less by the stampede to Salmon diggings.

The Oregon Democrat gives the following glowing news: Mr. I. V. Mossman & Miller's express, gives the following intelligence from Salmon river:

Regarding the killing of James Harman by M. Bledsoe, Mr. Mossman has placed in our hands the proceedings of a meeting held by the citizens at the mouth of Slate creek, Dec. 8th, and also the evidence of witnesses taken upon the occasion, which in justice to the parties we withhold until after due examination of the case by the proper authorities. The difficulty arose at the card table the night before, and was renewed the next day; hard words passed between the parties, when Bledsoe drew a pistol and fired the ball taking effect in Harman's forehead, and causing instant death. The citizens placed the offender in the hands of parties who are to bring him to this place for examination.

Mr. Mossman brought down thirty pounds of gold dust, and could have had much more if he had been able to bring it. From Slate creek to the diggings the snow is on an average six inches deep, save on the summit of the mountain where it is about six feet. There is no snow at the mouth of Slate creek, or foot of the mountains, but plenty of good grass for recruiting animals. From Robie's mill, near Col. Craig's, to the Camas prairie, there is some snow on the ground; the trail from this place to the foot of the mountain, with this exception is dry and hard. In the diggings the snow is about two feet deep. Some few miners were washing a little every day, but mining is obstructed by the snow and severe cold weather. All seemed satisfied with the prospects; and expressed confidence in the richness of the mines. At Florence city provisions range from sixty cents to one dollar per pound, and according to present indications will soon be abundant. On the trip down Mr. Mossman met about three hundred pack animals and two hundred or more men on their way to Salmon river.

W. BOHM'S BUCKLE INVENTION.

I desire to call the attention of the public to my late invention in the construction of

A NEW STYLE OF LADIES' BUCKLES,

for which I have applied for Letters Patent. It is by far the most beautiful ornament now in existence. In the MINING AND SCIENTIFIC PRESS a full description appeared. Messrs. Bravermann & Levy, 621 Washington street, have a complete assortment of all shapes and embellishments. Their cost is no more than the old style, and their simplicity and ease of adjustment considerably enhances their value. (Go and examine them!)

Bravermann & Levy,
621 Washington street, for W. Bohm.

WILLIAM L. DUNCAN, NOTARY PUBLIC,

REAL ESTATE AGENT.
OFFICE,

In Telegraph Office, Montgomery Block.

REAL ESTATE for sale in all portions of the city. Loans negotiated on Real Estate and other securities. Deeds, mortgages and Bonds, accurately drawn up. Soldiers' Pay Claims made out and purchased on liberal terms, and claims against the United States and State Governments collected. Fhl.

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, FEBRUARY 15, 1862.

NO. 22.

Southern Mines.

We take the following from the Los Angeles Star:
The late rains have of course been generally beneficial to the mining interests: but in some cases they have, even in our placers, been very destructive. At San Francisco Cañon, where a good number of miners are at work. Messrs. Moore & Slack had constructed a large reservoir, on which they had expended four months labor and a considerable money capital; the flood came down and washed away their dam and left them without the means of prosecuting their labor. This will prove a great loss to those working there, as this water was for the use of the miners generally, and would have afforded continuous labor for a long time after the cessation of the rains.

The prospect for miners in that locality is very good. We saw the washings from four pans of dirt, and it was fully a dollar and a quarter. With a sufficient head of water for sluice washing, this would prove really rich diggings. About six miles from the above parties there is another camp, where Long & Co., are making from half an ounce to an ounce a day.

In these camps large quantities of dirt had been thrown up; with a plentiful supply of water from the rains, all hands are busy washing out, and they are realizing very handsomely for the time and labor expended.

SALTPETRE.—Some uneasiness has been caused among the people by the announcement in late English papers that large quantities of saltpetre bought in England for our government had been stopped. We are able to say on the highest authority, says the New-York Evening Post, that this step cannot in the least embarrass us. The government has on hand now an immense supply of this article, most of which was put in store in the war of 1812. The amount of saltpetre now in government stores, we are assured, is sufficient for emergencies; and we suppose the recent purchases in Europe, if any were made, were intended only to add to the present store, in proportion as it was diminished in the course of the war, in accordance with that policy which induces every great government to keep on hand of this article at all times sufficient for a war of twenty or thirty years duration.

NEW WASHING MACHINE.—Messrs. Baker & Hamilton, of this city, are the exclusive agents for the sale of a newly invented washing and wringing machine, entitled the "Dash-way." It is unquestionably all that its inventor claims for it—the most desirable machine ever brought into use. We have witnessed it in operation by the side of machines claiming superiority, and can attest its faithful and speedy work. The proprietor who is now in this city, will give a practical test of this machine at any time when called upon, that purchasers may have the ocular demonstration of its capacity.

NEW DIGGINGS AT KNIGHT'S FERRY.—The Stockton Independent says that a private letter received in that city on Saturday speaks of the new gold diggings having been found the river at Knight's Ferry, on the 5th inst., by Louis aile and Henry Vahl. They obtained \$7,62 from thirty buckets full of earth. Quite an excitement followed this discovery, and the whole bank above and below the discovery was taken up immediately. The town of Knight's being rapidly rebuilt, according to a statement in the same paper.

ENLARGED.—The Herald and Mirror, lately consolidated to one concern, appears enlarged, and considerably improved topographically. The new concern has certainly made one great improvement—discharging that stereotyped caption, "copies of the day."

The New Mining Regions.

The Portland Times compiles a long account of the new mining regions. These mines, known as the Nez Perces mines, and situated for the most part at high elevations among the mountains, between the 114th and 119th degrees of West longitude, and between the 44th and 47th degrees of North latitude, were hardly known as a district for mining operations even in 1860. A few favorable reports having been thrown into circulation in the beginning of 1861, a furor was easily created, of a somewhat milder type than that which accompanied the gold fevers of by-gone times, and during the spring, summer and autumn of the past year, some seven thousand persons have resorted to these new mines for the purposes of mining, trading and speculation. Beside the Nez Perces proper, are the Colville, Similkameen, Rock Creek, Pends-Oreilles and Wenatchee mines, but the same may be said with regard to all of them—the few rich spots are at once selected by parties already on the ground, while hundreds of them make but paying or starving wages.

The latest discovery is at Powder River, where mines of surpassing richness are supposed to exist. Occasional patches of arable land are found along the elevated valleys, which are cultivated by the Nez Perces Indians, who are somewhat skilled in agriculture. On the bars of most of the rivers are good mines, in which some places largely remunerative wages have been made. The quality of gold found near Elk City is the best; that above Oro Fino the second in quality; and that about Salmon, the third. It is proved beyond all controversy that the head waters of nearly all the streams having their sources in the western spurs of the Bitter Root mountains are in the midst of rich gold deposits, extending almost continuously from the northern mines of California to the new and rich discoveries in the Caribboo district. The town of Lewiston may be reached from Portland at an expense of \$15, exclusive of outfit and living, except in winter, when all the routes are inaccessible.

THE SIX DAYS OF CREATION.—Archbishop Usher computed that the earth was called into being on Sunday, and was completed in its organization the Friday following. Mr. Phillips, the professor of Geology at Oxford, infers from the rate at which sediments are now deposited in different waters, the beds of coal, sandstone, shale and ironstone in South Wales occupied five hundred years in their formation; and applying the same data on a large scale, he says: "We have the calculated antiquity or the base of the stratified rocks 95,904,000 years." All the strata, except the very lowest, are replete with fossils, which were at first held to be curious spots of nature, but after accurate researches, are now recognized as vestiges of the innumerable vegetable and animal tribes which occupied land and water during the protracted term of their preparation for the abode of man. New relics of hitherto unknown species are almost daily discovered, and the whole so scientifically classed and arranged, that the nature and habits of these mostly extinct races are as clearly discernible as though they were now living and moving before us.

MINING IN BUTTE COUNTY.—The Appeal says that W. R. Dodge, who has a creek claim near Mountain House, No. 1, Butte county, picked up a quartz boulder weighing about fifty pounds last week, and found it thoroughly impregnated with gold. A lump weighing about ten pounds was pounded up crudely and yielded ten or twelve dollars in small bits of the precious ore.

CALAVERAS COPPER MINES.—The rainy season has checked business at Copperopolis, and put an end temporarily, to further prospecting, though parcels of ore continue to be examined and forwarded for shipment. The Union and Keystone companies are working about fifty men each, taking out as much ore as ever, according to a correspondence in the Calaveras Chronicle.

Will go to Caribboo.

Mons. B. Duffis, an old and much respected resident of Trinity, and a most thorough practical miner, will leave next week for the Caribboo country. Mr. Duffis has received letters from French friends in that section which has decided him to make a trial of that fabulously reported rich country. He goes to San Francisco, thence by steamer to Victoria, thence one day's river travel to Westminster, where he will join his friends who have come out from the mines to lay in provision. The distance from Westminster is about five hundred miles. They will leave that place about the first of March, and make the trip before the snows melt.

We wish our friend a safe and pleasant journey, and hope his expectations may be realized to the fullest extent.

Duffis is a practical miner, having worked in this county for eleven years, and accustomed to the hardships and privations attendant upon mining life. He goes with the intention of prospecting the country, and satisfying himself as to the truth or falsity of the reports which reach us from the Caribboo region. We have his promise that the readers of the Journal shall receive correct information relative to those mines as soon as he can furnish it. The well wishes of many warm friends attend him on his long, and necessarily tedious and unpleasant trip.

We have made the acquaintance of Mons. Duffis, by a letter of introduction from our esteemed friend, Dr. W. Ware, of Trinity county. We wish Mons. Duffis success, and a speedy return.—[En. Press.]

The editor of the Red Bluff Beacon has been presented with an excellent sample of tobacco raised in Shasta county. The editor says that knowing something about the culture of it, we unhesitatingly pronounce the Sacramento valley as well adapted to raising fine tobacco for smoking purposes, or cigar wrappers as any of the Union. The absence of dews prevents the leaf from attaining that thickness and gumminess which is so much desired by experienced tobacco raisers.

MORRISTOWN.—Weather remarkably cold. The mercury, Friday night, 31st, fell to four degrees below Zero. Work in the diggings entirely suspended, on account of water and every available substance being frozen up.

The American company sustained considerable loss by the rain, in breaking of ditches, by land slides, &c. Amount of damage not ascertained.

Place quiet, and miners waiting for a thaw.

COAL MINES DISCOVERED.—Out of evil comes some good. The recent heavy rains have so saturated the earth that land slides are prevailing all over the country. One of these occurred on the Petaluma valley side of the Sonoma mountain, and has revealed to view the lead of a coal mine. Of how extensive a nature it is, we cannot at present tell.—*Sonoma Co. Journal.*

ANOTHER STREET RAILROAD.—Mr. Lewis gave notice of a bill authorizing certain parties to lay a railroad track along Montgomery street and other streets in the city of San Francisco. The bill introduced by Mr. Dall, asking a similar franchise for Asa Lawton and Charles Hosmer, is still in the hands of the San Francisco Senate delegation.

THE WORLD'S FAIR.—The committee on mines and mining interests of our Legislature reported in favor of indefinitely postponing the bill providing for a representation of this State at the World's Fair.

A Halifax paper of the 13th announces the arrival of forty-five ounces of Tanager gold in bars, for which twenty dollars per ounce was asked.

The Discoveries of Leonardo Da Vinci.

Vinci has been well characterized as one of the most accomplished men of an accomplished age, and for the extent of his knowledge in the arts and sciences yet unrivaled. Although he devoted himself enthusiastically to painting, he appears to have found time also to sculpture, architecture, engineering and mechanics generally; botany, anatomy, mathematics and astronomy; and he was not only a student of these branches of knowledge, but a master.

None of the writings of Leonardo, says Hallam, were published till more than a century after his death; and indeed the most remarkable of them are still in manuscript. As Leonardo was born in 1452, we may presume his mind to have been in full expansion before 1500. His Treatise on Painting is known as a very early disquisition on the rules of art. But his greatest literary distinction is derived from those short fragments of his unpublished writings that appeared not many years since, and which, at least, according to our estimate of the age in which he lived, are more like revelations of physical truth vouchsafed to a single mind than the superstructure of it reasoning upon any established basis.

The discoveries which made Galileo, and Kepler, and Maestlin, and Manrolycus, and Castelli, and other names illustrious; the system of Copernicus; the very theories of recent geologists, are anticipated by Da Vinci within the compass of a few pages: not, perhaps, in the most precise language, or on the most conclusive reasoning, but so as to strike us with something like the awe of preternatural knowledge.

In an age of so much dogmatism, he first laid down the grand principle of Bacon, that experiment and observation must be the guides to just theory in the investigation of nature. If any other doubt could be harbored, not as to the right of Leonardo Da Vinci to stand as the first name of the fifteenth century, which is beyond all doubt, but as to his originality in so many discoveries, which probably no man, especially in such circumstances, has ever made, it must be an hypothesis not very untenable, that some parts of physical science had already attained a height which mere books do not record. The extraordinary works of ecclesiastical architecture in the middle ages, especially in the fifteenth century, lend some countenance to this opinion. Leonardo himself speaks of the earth's annual motion, in a treatise that appears to have been written about 1510, as the opinion of many philosophers in his age.

Mr. Hallam adds in a note, "The manuscripts of Leonardo Da Vinci, now at Paris, are the justification of what has been said in the text." Our historian then quotes from a short account of the MSS. by Venturi, published at Paris in 1797, a few extracts, whence we select the following:

In mechanics, Vinci was acquainted with, among other things, 1. The theory of applied forces obliquely to the power of the lever. 2. The respective resistance of beams. 3. The laws of friction, afterward given by Amontons. 4. The influence of the centre of gravity upon bodies at rest and in motion. 5. In optics he described the camera obscura before Porta; he also taught aerial perspective, the nature of colored shadows, the movements of the iris, the effects of the duration of visible impressions, and many other phenomena of the eye which are not to be found in Vitellio. Lastly, Vinci stated all that Castelli, in an age after him produced upon the motion of water, and thus gained the reputation of having been the first who applied the new doctrine of motion to hydraulics, on which subject he was long considered the earliest writer of the experimental school.

Leonardo must therefore be placed at the head of the writers on the physico-mathematical sciences, and of the true method of study by the moderns. The first extract Venturi gives is entitled "On the descent of Heavy Bodies, combined with the rotation of the earth." He here assumes the latter, and conceives that a body falling to the earth from the top of a ladder would have a compound motion in consequence of the terrestrial rotation. Venturi thinks that the writings of Nicholas de Cusa had set men speculating concerning this before the time of Copernicus.

Vinci had very extraordinary lights as to mechanical motions. He says plainly that the time of descent on incline planes of equal height is as their length; that a body descends along the arc of a circle sooner than down the chord; and that a body descending on an inclined plane will reach with the same velocity as if it had fallen down the height. He frequently repeats that bodies weigh in the direction of its movement, and weighs the more in the ratio of its velocity; by weight evidently meaning what we call force. He applies this to the centrifugal force of bodies in rotation: "Pendant tout ce temps elle pèse sur la direction de sa mouvement." Mr. Hallam then quotes another passage and adds, that if it be not as immediately expressed as we should find it in the best modern books, it seems to contain the philosophical theory of motion as unequivocally as any of them.

Leonardo had a better notion of geology than most of his contemporaries, and saw that the sea had covered the mountains which contain shells. He seems also to have had an idea of the elevation of the continents, though he gives an unintelligible reason for it.

He explained the obscure light of the illuminated part of the moon by the reflection of the earth, as Maestlin did long after him.

Vinci understood fortification well, and wrote upon it. "Since our time," he says, "artillery has four times the power it used to have, it is necessary that the fortification of towns should be strengthened in the same proportion." He was employed on several great works of engineering. So wonderful was the variety of power in this miracle of nature.

TRINITY COUNTY.—"Jacinto," a humorous correspondent of the *Trinity Journal*, winds up his letter thus:—A word about the mines and I will wind up this Sarsaparilla looking letter, sleep or no sleep. This bifurcated claim, which has a working interest in me, has paid well for what little work has been done. Water has been so irregular that I cannot guess what it has paid per day. Several claims on Union Hill have cleaned up well, I am told. Mason & Co.'s claim, paid \$4 a day, to the hand. Last year all the claims on this hill paid from \$16 to \$20 per day. All the ditch property in this vicinity has been greatly damaged. Only one or two of the smaller ones are running water. As for roads, there is no such thing,—played out six weeks ago. What few of the Douglas City people that haven't the Nez Perce fever are down with the measles. Hired man has just arriv, and says 'the country is safe.'

Our old friend, "English Tom," is doing smashing work this year in "Cooksey's Diggings," and thinks he has just got the thing "dead as a fish." We hear favorable accounts from all the dry diggings in the county, and have no doubt the large amount taken from these mines this season, will quite make up the loss of the river claims. Snow fell to the depth of five feet on Rush Creek mountain, last Tuesday and Wednesday.

We learn that all the miners working at "Bolt's Hill" diggings, are in fine spirits—have been at work for two months, and certainly will do a better season's work than ever before. These may be classed among the richest dry diggings in Trinity.

Mr. Smith has got the water in his ditch, and mining on Smith's Flat commenced on Monday last. The cold weather is not very favorable for mining operations.

KLAMATH COUNTY.—All along the Klamath, immense slides have occurred, the banks being very steep between Scott Bar and Orleans Bar. The mails have to be carried by footmen, and it is hardly passable for them. During the rains, the sides of the mountains were crawling—boulders, trees, and immense bodies of earth moving, rendering travel exceedingly dangerous. The citizens of Orleans Bar and Happy Camp have very limited benefit from mail or express business at present. Great expectations are anticipated concerning new diggings, as immense slides have opened places where the ground has every appearance of being rich. That country will no doubt, be full of Chinamen next summer, washing over these new places with their rockers.

Semi-Annual Mint Exhibit.

On the 31st ult., the Branch Mint of this city closed for settlement. The following is the exhibit of the gross amount of business done for the six months previous:

The total amount of Gold Bullion, delivered and charged W. S. Denio, Melter and Refiner, from July 1, 1861 to Jan. 18, 1862, is, ozs.	775,033:105	\$14,419,220 55
The amount returned and credited him during the same period, is, ozs.	774,868:603	14,416,160 05
Showing actual wastage, ozs.	164:502	3,060 50
Legal limit of wastage, ozs.	1,550:066	28,828 44
The total amount of silver bullion delivered and charged W. S. Denio, Melter and Refiner, from July 1, 1861, to Jan. 1862, is, ozs.	717,977:035	\$ 835,464 55
The amount returned and credited him during same period is, ozs.	777,660:045	835,095 80
Showing actual wastage, ozs.	316:090	368 75
Legal limit of wastage, ozs.	1,435:095	1,670 92
The total amount of gold bullion, delivered and charged Wm. Schmolz, Coiner, from July 1, 1861, to Jan. 18, 1862, inclusive, as per books, is, ozs.	778,887:057	\$14,490,931 53
The amount returned and credited him during same period is, ozs.	778,837:277	14,489,995 84
Showing actual wastage, ozs.	50:293	535 69
Legal limit of wastage, ozs.	1,168:033	21,736 37
The total amount of silver bullion, delivered and charged Wm. Schmolz, Coiner, from July 1, 1861, to Jan. 18, 1862, is, ozs.	605,498:055	704,515 20
The amount returned and credited him during same period, is, ozs.	605,442:076	704,151 20
Showing actual wastage, ozs.	55:009	64 34
Legal limit of wastage, ozs.	1,210:099	1,409 15

SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the *MINING AND SCIENTIFIC PRESS PATENT AGENCY*. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San Francisco.

It is generally much better to apply for foreign patents simultaneously with the application here; or if this cannot be conveniently done, as little time as possible should be lost after the patent is issued, as the laws in some foreign countries allow patents to any one who first make the application, and in this way many inventors are deprived of valid patents for their own inventions. Many valuable inventions are yearly introduced into Europe from the United States, by parties ever on the alert to pick up whatever they can lay their hands on, which may seem useful.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will accept the title.

It is also very unsafe to intrust a valuable invention to an other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Address, J. SILVERSMITH, SAN FRANCISCO.

N. B.—R.W. FENWICK, Esq., recently of the *Scientific American*, and for over fourteen years a successful patent solicitor in Washington, D. C., is associated with and will hereafter transact all business pertaining to patents for us, the patent office in Washington city. For instructions on the new law regulating patents, we refer the inventor to the above.

Miners, Inventors, Agriculturalists, Capitalist or Mechanics, will find it to their advantage to subscribe for the *MINING AND SCIENTIFIC PRESS*—being the only journal of that class published upon this continent. Issued every Saturday at four dollars per annum.

BOUND VOLUMES of the above journal can be had on application, also any back numbers.

J. SILVERSMITH, Publisher, PATENT AGENT AND SOLICITOR, San Francisco, Address: Lock Box, 537, Post Office, San Francisco, Wells, Fargo, & Co.

ORRICK JOHNSON PROPRIETOR.

Horses kept on Livery.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their

COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is complete, and will enable them to furnish every description of funeral, in a complete, and at the shortest notice.

All persons wishing to make interments in Lone Mountain Cemetery can do so by applying to us at 161 Sacramento street. MASSEY & YUN

Mining Companies and Associations.

Office of the Bullion Gold and Silver Mining Company.—November 5th, 1861. Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the sixth day of December next.

JAS. C. L. WAINSWORTH, Secretary.

Office of the Gold and Silver Mining Company, San Francisco, October 19th, 1861.—Notice is hereby given, that at a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one half of which was made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.

C. S. HIGGINS, Secretary.

Office Bullion Gold and Silver Mining Company, Van Horn District, 305 Montgomery street, San Francisco.—Notice is hereby given that the regular annual meeting for the election of officers for the ensuing year will be held at the company's office on the first Monday in December next, at 2 o'clock p. m.

T. L. BIDDINS, Sec'y.

Notice.—There will be a meeting of the Sides Gold and Silver Mining company, on Sunday, November 17th, 1861, at 11 o'clock a. m., at the house of M. H. Bryan, Virginia City.

A punctual attendance is requested, as business of importance will come before the meeting.

no 29

M. H. BRYAN, Sec'y.

Gold Hill Tunnel Co.—The meeting called for Saturday, November 9th, is postponed till Thursday, November 14th, 1861. The meeting will be held at the saloon of Webb & Coppers, Gold Hill.

A punctual attendance is requested, as business of importance will come before the meeting.

ROBERT APPLE, Sec'y.

Shareholders of the Gold Hill Gold and Silver Mining Company are hereby notified that a meeting of the Trustees in Gold Hill, on the 4th inst., an assessment of twelve and one half cents per share was levied on the capital stock of said company, payable on or before the 20th inst., to the Superintendent, at his office in Gold Hill, or to WM. B. AGARD, San Francisco. Shareholders failing to pay said assessment at the time required are hereby notified that so much of their respective interests in said company as will be sufficient to pay their several delinquencies, will be sold at public auction in front of the office of Wells, Fargo and company at Gold Hill, on the 9th day of December next.

By order of the Board of Trustees,

Gold Hill, Nov. 4th, 1861.

Postponement of Sale.—The sale of mining ground, at Silver City, by the Kane's Mining company, is postponed until four o'clock, p. m., Tuesday, Nov. 13th, 1861. Sale to take place on the grounds of the company. Delinquents will please take notice and come to time.

By order of the Board of Trustees,

R. C. CHAPPELL, Sec'y

Virginia city, Nov. 9th, 1861.

Office Chollar Silver Mining Company, 612 Front street, San Francisco, Nov. 20th, 1861.—The annual meeting of the Stockholders of this Company will be held at their office in this city, WEDNESDAY, December 4th, 1861, at 11 o'clock A. M.

W. E. DEAN,
Sec'y Chollar S. M. Co.

Golden Gate Company, GOLD HILL DISTRICT.—A meeting of the shareholders in the above named company will be held at the office of H. O. Gaylord, in Virginia on Saturday, Nov. 16th, at 7 p. m.

By order.

T. A. MONKHOUSE, Sec'y.

Members of the Senator company, Congress Ledge, Devil's Gate District, are hereby notified that an assessment of twenty five cents per foot was this day levied by the Board of Directors, payable to the Secretary at his office, in Virginia, on or before the 15th day of November, instant.

L. W. FERRIS, Sec'y.

Office of the Colorado Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Colorado Silver Mining company held Oct. 25th, 1861, an assessment was levied of one-tenth of one per cent. on the capital stock of the company, being fifty cents per share, payable within thirty-five days to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.

By order of the Board of Trustees.

J. R. COFFIN, Sec'y.

Office Dios Padre Gold and Silver Mining Company, 215 Front street San Francisco, October 20th, 1861.—A meeting of the stockholders of the Dios Padre Gold and Silver Mining company, held at the office of the company, on Saturday, November 16th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting. By order of the Board of Trustees.

JOS. P. NOURSE, Secretary.

Office Rogers' Silver Mining Company, San Francisco, October 15th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 15th day of November, 1861, at the office of the company, in this city.

By order of the Board of Trustees.

JOEL F. LIGHTNER, Secretary.

Office of the Sucker Gold and Silver Mining Company, Nos. 1 and 2 Montgomery Block, San Francisco, California.—Notice is hereby given that the annual meeting of the Stockholders of the Sucker Gold and Silver Mining Co. will be held at the office of the Company, Nos. 1 and 2 Montgomery Block, on the first Monday after the first Tuesday of January, A. D. 1862, at ten o'clock a. m. of that day, for the election of Trustees, and for the transaction of other business.

By order of the Trustees.

R. H. WALLER, Secretary.

Notice is hereby given to the members of the Arizona company, that there will be a meeting of said company held at the Recorder's office, in Virginia city, N. T., on Saturday the 23d inst., for the purpose of organizing said company. All delinquents are notified that unless their assessments are paid by said date, their interest in said company's claims will be sold to pay the same.

R. T. SMITH,

President Arizona Company.

Office of the Desert Mining company, 509 Montgomery street, San Francisco, Nov. 23, 1861.—The stockholders are hereby notified that an assessment of one dollar per share on the capital stock of the Desert Mining company, has this day been levied, payable on or before the 25th day of Dec. next, at the office as above.

By order of the Board of Trustees.

J. H. LYON, Sec'y.

Notice.—The regular annual meeting of the stockholders of the Cedar Hill Tunnel and Mining Company, will be held at the office of the Secretary, on Thursday, January 24, 1862, at 7 o'clock; p. m., for the election of officers for the ensuing year, and such other business as may come before the meeting. San Francisco, December 24, 1861.

C. L. FARRINGTON, Sec'y.

Office of the (Bass District) Union Gold and Silver Mining company, San Francisco, Dec. 13th, 1861.—The stockholders are hereby notified that an assessment of ten cents per share on the capital stock of the Union Gold and Silver Mining company was levied on the 12th inst., payable on or before the 15th of January, 1862, at the office of the company, 410 Montgomery street.

By order of the Board.

C. J. HIGGINS, Sec'y.

Notice is hereby given that an assessment of One Dollar per foot (share) has this day been levied on the ground of the Alambra Mining company, payable at the office of the company, 815 Sansome street, San Francisco.

By order of the Trustees.

J. O. STRAUCH, Secretary.

November 24th, 1861.

Office Ophir Silver Mining Company, San Francisco, Nov. 26th, 1861.—The Annual meeting of the Stockholders of this company will be held at their office in San Francisco, on Wednesday, December 11, 1861, at 11 o'clock, a. m., for the election of officers for the ensuing year, and transactions of such other business as may be presented.

JAS. W. WHITE, Sec'y

ADRIATIC CO.

Postponement of Sale.—Delinquent stockholders are hereby notified that the sale of delinquent stock advertised to be sold on November 10th, has been postponed until Thursday the 21st inst., at which time all delinquent stock will positively be sold in front of the Secretary's office, at 1 p. m.

By order of the Board of Trustees.

JOHN G. GILCHRIST, Sec'y.

Virginia city, November 10th, 1861.

A Meeting of the shareholders of the Summit company will be held at the Gold Hill Bakery, in Gold Hill, on Friday, Nov. 15th, at 7 o'clock p. m.

Punctual attendance of the shareholders is requested, as business of importance will be transacted. By order of the President.

JOHN DOYLE.

Savage Gold and Silver Mining company. A meeting of the stockholders in the above company will be held at 10 o'clock, A. M., the 17th day of December 1861, at the office of Leut. Sherwood & Co., in this city, for the transaction of important business. Parties claiming an interest in the above company will please hand in an abstract of their title either to Robert Morrow at Virginia city, or to A. K. Head Nevada, or the undersigned before the 14th day of December next.

WM. M. LENT, President.

San Francisco, November 27, 1861.

Office Crown Point Gold and Silver Mining company, 321 Front st., San Francisco, Oct. 28th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees, will be held at the office of the company, on Wednesday, November 20th, at one o'clock P. M.

O. B. CRARY, President.

Office Crown Point Gold and Silver Mining Company, 321 Front street San Francisco, Nov. 6, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining company has this day been levied, payable on or before the 19th of December next, at the office, as above.

J. H. JONES, Sec'y.

Office Sierra Nevada Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 25th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City; or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees of S. N. S. M. Co.

J. H. BREWER, Secretary

Office of the Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that all stocks on which assessments are now due, and unpaid after thirty days from date, will be advertised and sold, according to the laws of California and the By-Laws of the company.

All parties holding stock of this company are requested to hand it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees.

JOSH. S. HENSHAW, Sec'y.

Office of Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty six or ninety days from date, to the Treasurer of the company.

By order of the Board of Trustees.

JOSH. S. HENSHAW.

Notice.—A general meeting of stockholders, of the New Idria Mining Company will be held at the offices of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.

By order of the Board of Trustees.

HENRY S. HUDSON, Sec'y.

San Francisco, Nov. 8, 1861.

Notice.—The annual meeting of the Charles Cany mining company, will be held at the office of the company (D. Davidson's room, northeast corner of California and Montgomery street, San Francisco) on Friday Dec. 27th, A. D. 1861, at 3 o'clock, p. m. of that day, for the election of officers for the ensuing year, and transaction of such other business as may be presented. A punctual attendance of all stockholders is requested.

By order of the Board.

ALEX. FLY, President.

Office of Sucker Gold and Silver Mining company.—Notice is hereby given that the Board of Trustees of this company (formerly the Sucker company, Gold Hill District.) have this day, Tuesday, Nov. 19, 1861, duly levied an assessment of fifty cents upon each share or foot of the capital stock of, or ownership in, said company, payable immediately to the Secretary, at their office, Nos. 1 and 2 Montgomery Block, San Francisco, or to J. A. Hobart, Trustee at Gold Hill, Nevada Territory. On default of payment of which assessment for thirty days after publication of this notice, all delinquent stock and ownership will be sold according to law, and the rules and By-laws of the company.

R. H. WALLER, Sec'y.

Notice.—Notice is hereby given, that Jos. J. DuPrat is the only authorized agent in California, U. S. of America, for the silver mines known as "Mina Rica," "Gnasaba," "Fortuna," "Santa Cruz," and "Nacimiento," situated near San Antonio, Lower California, Mexico.

CHAS. J. DUPRAT,

EM. LEYA,

DUPRAT, SCHMITZ & CO.,

CHAS. KRAFT & CO.,

La Paz, Lower California, July 30th, 1861.

For the purposes of reference, the deeds of the above named mines have been recorded in the city and county of San Francisco, State of California. For further particulars respecting the above named mines, inquire of

JOS. J. DUPRAT.

43 Washington street.

Office of the Bullion Gold and Silver Mining Company, 410 Montgomery street, San Francisco, Jan. 13, 1862.—Notice is hereby given that at a meeting of the Board of Directors, held on the 11th inst., an assessment of ten cents per share was levied on the capital stock of this company, one half of which is called forthwith.

By order of said Board.

C. S. HIGGINS, Sec'y.

Office Cedar Hill Tunnel Mining company, No. 609 Sacramento street. An assessment of Two hundred and fifty dollars per (original) share has been levied by the Trustees, payable as follows: Twenty per cent. on the 15th of January, and twenty per cent. on the first of each month following until paid in full.

San Francisco January 14, 1862

CHAS. L. FARRINGTON, Sec'y.

Office of the Falls of Clyde Consolidation Gold and Silver Mining Company, New No. 634 Washington street, San Francisco, January 3rd, 1862.—At a meeting of the Board of Trustees of the Falls of Clyde Consolidation Gold and Silver Mining Company, held January 3rd, 1862, an assessment of one eighth of one per cent. on the capital stock of the company—being twelve and one half cents per share—was levied, payable within thirty days from this date, at the office of the company in this city.

W. L. BUNCAN Sec'y.

Shareholders of the Osceola Gold and Silver Mining company are hereby notified that the meeting of the Trustees of said company in Virginia city, on the 2nd inst., an assessment of twenty cents a share was levied on the capital stock of said company, payable on or before the 20th instant to the Treasurer, at his office in Gold Hill, or to D. H. Russell, Virginia city.

Shareholders failing to pay the assessment at the time required, are hereby notified that so much of their interest in said company as will be sufficient to pay the amount of their delinquencies will be sold at public auction, in front of the saloon of Lindington & Russell, in Virginia city, on Saturday, the 10th day of December next, between the hours of twelve and three p. m.

J. S. WATKINS, Treasurer, Osceola G. & S. M. Co.

Virginia city, Nov. 2, 1861.

Notice to Quartz Miners.

The Union Gold and Silver Mining company having opened their mineral rodes in the R. D. District to an extent satisfying them of the value of the same, and having contracted for the erection of a quartz mill near said rodes (not exceeding five miles distant) are now desirous to contract with responsible parties for mining and delivering at an early day, at the said mill, not less than one thousand tons of quartz rock. Proposals will be received until the fourteen day of February next. For further particulars enquire at the Office of the company, 410 Montgomery street, San Francisco.

C. S. HIGGINS, Sec'y.

Office North Potosi Silver Mining Company.—Notice is hereby given, that the Trustees of the North Potosi Silver Mining company, have, this sixth day of January, 1862, levied an assessment of one dollar per share upon each and every share of the capital stock of said company, payable on or before the fifteen day of February, 1862, to H. A. Eastman, at Virginia City, or the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees.

J. H. BREWER, Sec'y.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of every thing generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers.—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80 Names can be sent in at different times and from different Post-offices Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Lock Box 537, P. O.

Room 24, (formerly) U. S. Court Building, Corner of Washington streets, San Francisco.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY..... FEB. 15, 1862.

The MINING AND SCIENTIFIC PRESS published is at 522 Merchant bet. Montgomery and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C. is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

Distinguished Legal Copartnership.

We clip from the New York World, of a recent date, the following:

WASHINGTON Aug. 8.

Judge Lawrence, so long a prominent member of the Board of Appeals, in the United States Patent Office, has resigned and connects himself in business with Robert W. Fenwick, an established patent agent in Washington.

The readers of the PRESS will bear in mind that Mr Robert W. Fenwick, Esq., is our associate at Washington, D. C., in the American and Foreign Patent Agency for the Pacific Coast.

In the acquisition of Dewitt C. Lawrence, Esq., a member of the Supreme Court Bar, who also filled the office of chief clerk in the Patent Office over twelve years, acted in the capacity as Patent Commissioner, and Primary Examiner, also as a member of the Appeal Board. (While he served in the latter position he prepared a splendid work on Patent Laws—Patent Office Practice—and the Practice of the Courts), all of which he brings into the Copartnership in manuscript, together with an experience of nearly twenty years, and a knowledge of patent matters not possessed by any other agency or solicitors in the United States.

REMOVAL OF THE "PRESS" AND PATENT AGENCY.

The business of this office having become quite extensive, it therefore made it incumbent upon us to remove from our offices in the Government House, where we had scarcely room enough to do our regular office business. We occupied said premises for nearly two years, and were really loth to leave them. Circumstances have placed us so that we now can enjoy separate offices for the printing of our MINING AND SCIENTIFIC PRESS; and the applicants for letters patent need no longer be interrupted by the thousand and one inquiries heretofore made, while we occupied said offices.

We have moved our printing rooms to Merchant street, No. 522, between Sansome and Montgomery up stairs, and the

PACIFIC PATENT AGENCY

and the Editorial rooms are now eligibly situated in the former U. S. Court Building, northeast corner of Battery and Washington streets, in room 24. All persons having business with us will favor us with a visit as early as convenient. Letters will be addressed to us in accordance with the above.

California Richer yet than Washoe.

It may sound somewhat grating to those interested on the other side of the Sierras, that California is yet richer in metallic wealth than Nevada Territory, and to establish the truth thereof in a very few words, we will take it for granted that Washoe is one continuous rock bed of silver—now the labor, scientific skill, capital, immense loss of time, render a poor remuneration in comparison with the poorest quartz claim in California, that may not pay more than

twelve or fifteen dollars per ton, and which may be worked and treated in the ordinary and most primitive manner. A little reflection on this subject will readily convince our miners of this fact. We know that the little county of Amador is one of the richest gold quartz bearing districts in this State. A Mr. Heywood clears from a single lead \$150,000 every year, and though other counties in this State have been landed for their richness, yet little has been said respecting this county. The fact is we know too little of the immediate wealth that is hidden beneath the very soil we are treading. Our geologist may be diligent enough in giving us that which has come immediately under his supervision, and for the purposes of which his office has been created; but that we do require the aid of a number of scientific men to guide our "delvers in rock," is a most deplorable necessity. At present the miner gropes in darkness, that is without the necessary knowledge of rocks, stratifications, or any geological principles—and what is most to be regretted is the utter ignorance or unwillingness to admit of such knowledge or principles to be applicable to our sphere of mines. If our Legislature had the wisdom they should have we could soon be possessed of that, which would bring us on an equal footing with less wealthy countries: that is, the appropriation of sufficient money for the carrying on of a good mining school—since nothing but science in that quarter will ever develop our country, or point out the concealed wealth. Millions of dollars have been spent, all to no purpose, in finding leads, all of which might have been averted had the miner been guided by any fixed principle!

Would not the ultimate result from such a school be great? we ask; great beyond a question. The student who has received the requisite instructions requires but a glance of any district which is supposed to be impregnated with precious metals and he can readily test it, and work to advantage: it would give a new impetus to our chief resource—mining.

The establishment of such an institute would forever banish the migratory or spasmodic fits and fevers that sway our mining community by excitements; because where they know that the mine they are working will pay, they could not be induced to leave for such myths of either a Salmon, or Cariboo, fables.

The late floods have produced some new features; much that has been in the way of debris has been cleared, and we will hear of immense rich "placers," and those who are sensible enough to remain will reap the benefit of them. That California has the mines not only rich, but convenient and accessible is too well established. We want a little science in this matter, and would therefore beg of the Committee on mines and mining interest to recommend the erection of a mining institute.

Geology as Applied to Mining and Mining Engineering.

Thus far the mining community on the Pacific slope have worked for a period of thirteen years, so to say, with the rudest principles, or tools as might have been suggested by Adam, and all this happened in the midst of enlightened Europe, and in the face of inventive "yankees." It is true we export on an average from three to four millions of dollars from this State each month, but what would this amount compare to were mining carried on with science and system? Is not every miner aware that as many millions of dollars have been spent in building useless tunnels and shafts. In Europe schools for mining and mining engineering have existed for nearly two hundred years, more especially, however, in Germany, France and England. It were useless for us to enumerate all the branches taught in these schools, suffice it to say that all those who leave it, after having gone through the various courses are, well versed in geology, paleontology, mineralogy, chemistry, engineering, surveying, assaying, smelting, etc.

Such a school the State of California should possess; the country, her interests, and the people demand it. We see no reason if the mineral lands are to be taxed, but that they have such an institute as a bonus therefor.

The services of a number of professors, together with the requisite apparatuses, apartments, would not extend \$15,000 per annum.

The school need not be free to students; let those who are able pay for the courses they enter for, and we doubt not that the school will ultimately prove a paying institution to the State, instead of an expense.

The retrenchment system with our State Legislature seems to be a particular hobby at present, and the chances for the passage of a bill providing for such an institute, would stand but a meagre chance.

To Patentes.

We are constantly employed in preparing applications for patents—some of the inventions and improvements having appeared with comments in the PRESS; truly California has furnished thus far some of the most useful and novel inventions of the day. We have in our midst mechanics and scientific men, whose skill well compares with their fellow workmen in older countries. There is, however, one thing they are deficient of, and that is their timidity in bringing their inventions before the public, which is either produced through fear that infringement might be effected, or that they desire to reap the whole benefit themselves from such discovery, both of which conceptions are not well founded, since the first inventor is always secured against infringement; and in the other case, they might possibly realize ten times as much by the sale of wrights, than by applying or using it themselves, besides gaining a name as an inventor, and otherwise conveying some useful object upon his fellow beings.

We are at present the only capable Patent Solicitors on this coast, with experience and facilities seldom offered by any one. The columns of the PRESS are ever open to inventors and discoverers. We charge nothing for our advice, except when a case is given us for litigation or otherwise.

The Whole Sacramento Valley a Coal Bed.

Recent researches have plainly demonstrated that the coal measures or deposits are not entirely confined to Monte Diablo or Corral Hollow districts; these were among the first discovered; later discoveries near Napa city have been made, and the discoveries in Tehama county, as well as at other points throughout the State, establish the fact, that an immense bed of coal must exist in the Sacramento valley; even beyond the Sierra Nevadas we learn that a similar stratification continues. We are not prepared to say whether the latter is either a deposit of the same period or quality as that formed on this side. Geological researches thus far on this subject are silent, and sooner or later we may learn through that body composing the State survey, this fact. If we take into consideration past experience, obtained in Europe or America, that what we assert must prove true. To arrive at correct depths as to the situation of these coal beds, it is necessary that a precise topographical map should be made, the dips and courses of the layers ascertained, which done will place California foremost in that product.

Another Exodus.

The fever rages! and the excitement is rife! disoriented miners must have their periodical spells of migration. They have been warned, and they have suffered by not taking the advice. They will forsake good paying claims, and spend their earnings in making a prolonged tour, through a rough, uninhabited, wild country, and with the perils of losing their lives, where the prospects of doing better than here are mere imaginations. We could enumerate the exact period and number of excitements since '49, and of which a full list appears in our work, entitled the *Miners' Companion and Guide*. The Marysville Express, through its correspondent at Grass Valley, writes as follows:

"A burnt child dreads the fire," is an old saying, and generally received as a true one, but it certainly won't apply to California. Our California history demands an entire change in our whole system of proverbs, axioms, etc. Men here will not be taught by experience. No sooner have they passed through one calamity than they are ready to challenge another. Whilst the scars and bruises of one unfortunate adventure are still on them, they impatiently wait and eagerly watch for another. No sooner has the vision of "Gold Lake" vanished, than they are ready to cry out in honor of the Kern River phantom; and when this Will'o the Wisp has escaped them, leaving them poor, miserable and wretched, they rally to the cry, "Frazer River," and although that river has proved the very Styx to multitudes, making hundreds poor and but few rich, and whilst the remembrance of the cruel deception is still clear, and purses emptied then

have never since been filled; still notwithstanding these glaring deceptions, which are but the index to a large volume of other equally severe ones, our people are ready again to leave comfortable homes, paying diggings, pleasant society, intellectual and religious privileges, ready to leave all to explore the hospitable regions of delightful Carriboo. And even here in Grass Valley, where the mines are real, not imaginary, and where their bottom never has yet been reached, and no man has ever marked the extent of the golden harvest field; here where almost every stroke of the pick pays, and whatever the hand of honest industry touches, it turns to gold; yet even here the Carriboo fever begins to appear. Surely Californians ought to have had experience enough in golden hangings to make them the most cautious of people; and yet in the very midst of such they have become proverbial for their love of adventure, prospecting, etc. I suspect that old refuse merchandise, mouldy, rusty, and out of date, found only storage, not sale, in the Frazer River region; this has brought to light the gold of Carriboo. It is wonderful what discoverers of mineral wealth old dry goods and rusty machinery are. And it is remarkable that merchants in large cities are generally the first to see gold in the mountains; especially when these goods can be sold rapidly and at enormous rates. All we have to do now is to collect a huge pile of damaged goods, shake them a few times, utter a few magic words, and behold! mines of inexhaustible wealth appear—on paper, and that is all.

Now, if Carriboo is only another Frazer River, simply a depot for unsalable goods, I hope the honest but deceived miners, when they discover the "sell," will take their picks, open the warehouses, dig out the goods, empty the rooms, take all, everything, and return to their homes richer and better men, and leave the Gentile or Jewish Shylock without their pound of flesh. "I fear the Greeks either bringing or asking presents."

Shall I go to Carriboo?

SAN FRANCISCO Feb. 12, 1862.

ED. MINING AND SCIENTIFIC PRESS.—SIR—Hearing as I do so many reports, both favorable and otherwise, concerning the Carriboo mines, I confess myself puzzled what to think of them, and whether to venture a trip there or not. Feeling that you must be posted as regards these matters, being the publisher of a mining journal, I would beg of you to give your opinion through its columns, for my benefit as well as numerous others of my acquaintances who are in the dark.

Very respectfully—

This is but one of the innumerable letters that have been sent us lately as regards this question; it has been put to us until we are thoroughly tired of it; the enquiry comes from all classes and conditions. The majority appear to be, as it were, "on the fence," bearing a little to both sides, apparently undecided whether to go over or not: such men as these we opine have been "on the fence" all their life, and will die thereon! These men are what we style in California the "floating population;" they are to be seen in every city and town in California, and since Sacramento has been flooded, thousands of these amphibious bipeds may be seen "floating" around our busy streets, with their hands in their pockets, walking as though they were fast becoming "web footed;" for all such we would not give an old hat; they never did nor never will amount to anything, and no reliance is to be placed in them. What need then is there of expressing an opinion to such! we will not waste the time. To those restless individuals, we would implore them "go by all means!" A good riddance (for awhile only, alas!) to bad rubbish, for we know that they will never reach their destination!

But to the hard working miner we have a word to say, we have always opposed through the columns of the Press these periodical excitements, which appear to come as regular as do the seasons with us. Do not think of going unless you have ample funds, and an unusual big lump of perseverance; these two are the main points and first to be considered. Thousands will start for the mines, but only tens will in reality reach them; this has always been the case. That there is mineral wealth in that locality cannot be denied, but to what extent we are unable to estimate; that is yet to be determined. If you now have a good claim and a "prospect" before you, in closing we would say, "don't go! vide Frazer River."

Resolutions on the Taxing of Mining Claims.

The several bills, amendments and resolutions, presented to the Legislature on the taxation of mining property have not been fully examined by us, we will therefore forbear from passing a hasty opinion on the same, suffice it to say that some of these have been carefully but leniently drawn up, while some other bills would engulf those who have yet to realize anything from their enterprises. It is hardly presumed that an exacting tax bill would pass our Legislature, and the reasons are patent, since the majority of the members are from mining districts, who comprehend the conditions and circumstances of our present mining prospects too well, and would therefore not burden their constituents with any heavy taxation. But aside from this, it is not expedient to tax at random a class or community (except such who have well established and paying claims) in whose prosperity the people of this State feel deeply interested, because it being our chief resource, and from whence we derive the "wherewith" for shipment to foreign lands for our commodities or merchandize.

We question much the right of any State Legislature to tax its mining districts, since the title to mineral lands is entirely vested in the General Government, and as it is in all other countries; it would therefore require a special act of Congress to empower our Legislature to pass such an act.

A Universal Language.

Our correspondent of Berlin, Germ., informs us of a great enterprise, which at present engages one of the most celebrated professors on the Royal University, and which is talked of with great excitement among the savans of the transatlantic hemisphere;—it is no less than the construction of a universal language, strictly conforming to rules of grammar, without exception, and preserving the idioms of the different nationalities, yet based upon the most simple and easily comprehended principles, so that the same be adopted for the intercourse of all civilized nations. A large amount of presswork belonging to this curious work is already finished, and the first volume may soon be expected to be issued.

Mining Stock.

The following items concerning some of the mining stocks and their prices may be of interest to our readers.

On Ophir company's shares, Comstock Lode, no dividends have been declared during the past year. The yield of the mine is set down at \$50,000 dollars per month—expenses \$25,000 per month. The balance has been expended in improving the mine and in the purchase of additional machinery. After the present date the company can reduce twenty-five tons of rock per day, or double their former capacity, and dividends of one per cent. upon the capital stock are expected to commence in March.

Their shares rate at \$875 per foot, in market, but at private sale \$1000 to \$2000 was asked. The company own 1,400 feet of mining ground.

The Central Company's mill, just completed, has a crushing capacity of about ten tons per day. Shares in market six hundred dollars per foot—own one hundred and fifty ft. of mining ground.

California Company's is controlled by Barron & company, San Francisco; rates at three hundred dollars per foot—claim 300 feet.

Mexican company's stock is controlled by Alsop & company. Product of the mine and mill \$40,000 per month, and no stock in market.

Gould & Curry company's mill will not be completed before May or June—capable of crushing sixty tons per day. Their rock crushed at the Central company's mill yielded from \$150 to \$300 per ton. Size of claim 1,200 feet—shares, with assessments paid, only \$375! They are well worth \$1000 per foot.

The different Gold Hill claims (all gold) have been worked at a profit of from \$100 to \$200 per foot each month, but the excessive wet weather of the present, has caused almost a total suspension of work. There are 600 feet in the different paying claims on this lode.

The Daney lode and claim of 2,000 feet has sold at \$250 per foot.

Lucerne company expect to commence crushing in this month, rock from their lode. Claim 1200 feet—rates at \$30 per foot.

St. Louis company will commence soon to crush from their lode—claim four thousand, valued at ten dollars per foot.—*Silver Age.*

The Eclipse mill at Gold Hill, and Smith, Little & Co.'s mill at American Flat, are both running and appear to be doing good work.

Celestials.

The Herald & Mirror are out with the following, on the immigration of Chinese or Mongolians; that some effectual law should be made and passed is only too well manifest, to prevent this filthy set of beings from infesting our fair land. We trust some eloquent member will prepare a bill that will reach this case.

The recent complete revolution in Governmental affairs in the Empire of China will give a greatly renewed impetus to the passenger traffic from that kingdom to our shores. We already begin to experience the influence of this turmoil in the numerical increase of the Celestial multitude that are streaming hither. If we are ever to have a settled policy in regard to this immigration, now is the time to agree upon it. If it is utterly impossible to pass a law which shall effectually stop or largely hinder this influx of an inferior, demoralized and demoralizing race, we should know it at once, or we should place ourselves on the shore path to that knowledge. If the National Congress and not our State Legislature, possess restricting power in the premises, that is the point for immediate settlement and understanding.

It seems to us that in determining questions now existing at the very threshold of a proposition for any law upon this subject, various processes of investigation can be adopted. But if the answer to the questions preliminary to a direct law cannot be obtained for a considerable period—as it very likely may be—it behooves us in the interval to adopt some measures calculated to control this immigration, and to a certain extent, in some unobjectionable manner, to filter and diminish it.

At the very least we can in a worthy degree determine, by an unexceptionable law, the character of the tide of population settling in upon us from the West. By a proper quarantine law passed solely for this purpose, we might prevent the importation of Asiatics of an exceedingly filthy type, and the bringing in and employment of Chinese slaves. A law of this nature and application, which would avoid the objections against the constitutionality of a former enactment, would be placed in force, and so held up in the mode and manner in which a direct and sweeping provision against Chinese immigration can be made or discovered, and the discovery improved.

Holcomb Valley Mines.

E. Mellus and J. C. Nichols Esqrs., returned here this week from the Holcomb Valley mines. They report everything in the way of mining in that quarter prosperous. The quartz mills of Mr. Mellus and Mr. Nichols, and also the mill of Tibbetts & Co., were in full operation. The quartz which is at present worked at their mills yield an average of twenty five dollars per ton, from rock taken from the veins without selection. A large number of placer claims are being worked, and preparations were being made for opening a number of new-placer diggings. Considerable snow had fallen in the valley since the beginning of the winter season, but each snow storm had almost invariably been overtaken by rains or warm weather sufficient to keep the valley pretty much free from snow up to the time these gentlemen left there; about ten days only had elapsed after a heavy fall of snow; during which time there was no communication with the valley from other points. Every cañon, gulch, etc., was filled with water, affording brilliant facilities in this respect for sluice washing in nearly all the placers already opened, and enabling those having rich diggings to work them successfully. There were about one hundred men in the mines, and to their credit it is stated that not one was to be found idle; all were doing well. The average amount of gold obtained from the placer diggings ranges from five to fifteen dollars a day to the man. The greatest activity prevailed among the miners, and a rich harvest was before them. There never was before for many years such an amount of water in the valley, and such a body of snow in the San Bernardino mountains, as at the present time. The wagon road was open and nothing had occurred since the commencement of the winter season to obstruct it in the least. The Mojave river was very high; many lakes were visible on the desert from high points along the road. At Lane's crossing the river appear to be several hundred yards wider than has ever been known before. The rain in that direction has had the effect only to settle the sandy roads, produce a fine growth of grass and yield an abundant supply of water for mining purposes. The mines of Holcomb and vicinity are now more prosperous than at any time during the work of prospecting and opening commenced.

It is thought that much mineral wealth will be exposed to view in that locality in places where deep cuts have been made by the late torrents which are now finding their way through the cañons of the San Bernardino range of mountains.—*Los Angeles Star.*

COLORADO MINES.—By recent arrivals from these mines, we learn that claim-holders are busily engaged in prospecting and developing their recent discoveries. The lodes turn out to be richer than the most sanguine anticipated; a few companies have already erected arrastras, and we expect, are, by this handling the golden metal. In a few week's time we will know something definite from this locality.

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends they wish disinterred, are informed that I have the most complete registry in existence of graves in that cemetery, having added to my own records, by purchase, the books of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

THE MINER'S COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 60 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 30 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for carrying and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

A Book for the Miners.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work is the "Miner's Companion and Guide, and treats of California Mines exclusively. It will prove a most valuable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[San News.

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press" for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's treasured its hidden treasures.—[Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some thirty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300—1000ths. fine. 3cts per oz.
" from 300—1000ths. to 750—1000ths. fine. 7cts. " "
" " 750—1000ths to 950—1000ths " 14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce 1/2 per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " " " 14cts " "

DEPOSITS FOR FINE BARS.

\$116-4-11ths cents. per standard ounce, 1/2 per ct. gross value of silver for making bars; also when gold is contained 1/2 per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. 1/2 per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$116-4-11ths. per standard oz. 1/2 per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$116-4-11ths. cents per standard oz. 1/2 per ct. gross value of deposit for making bars.

In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of 1/2 per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

PATENT FOUNDRY AND MACHINE SHOP, First street, between Mission and Howard, San Francisco, California.—By recent additions to our extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Mills and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flaming Mills; Gang, Sash, Muley, and Circular Saw Mills; Single Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron, Car Wheels and Axles of all dimensions; Building Frames; Horse Powers; Saut Mills; Boiler Fronts; Wind Mills; J. Hunt's, Johnson's and Lam's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GOLDALD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Wasboe
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogdon & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work. The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND SPECIAL ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver aving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and strike to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.

LEWIS COFFEY;

J. N. RISDON

Mexico.

California is fast becoming a manufacturing country, since every day ushers some new enterprise, through which we gain stability and permanence. The millions of dollars sent annually for furniture to the Atlantic States, it may be said, is now at an end; not only does it keep the money at home, but employs a number of mechanics, whose labor will be well remunerated, and will give them constant employment. The above handsome illustration has been engraved at the office of this paper, and presents a front view of the premises now occupied by Messrs. Constine & Co., Furniture Factory, covering an area of 95 by 137 feet, on Fremont street, between Market and Mission streets, in this city. In it are eight spacious apartments with innumerable windows and lights, comprising the cabinet makers, joiners, varnishing, glueing, carvers, steam engine and boilers, and upholstering rooms. It is the intention of the proprietors to produce an entire new style of furniture, made of the best material, and finished in the most approved manner. We are preparing a series of engravings, each of which will present the different departments, which, together with a description will appear in the PRESS.

Distance from Red Bluff to the Humboldt.

We have been favored with the following table of distances from Red Bluff to the Humboldt mines, via Jelly's Ferry, which will be found very useful to those about to start in that direction. Mr. McBeth, the gentleman who furnished us with the statement, is well acquainted with the route and can be relied on as correct. He also states that the distance can be shortened some forty or fifty miles by the proposed new road from Red Bluff to Honey Lake Valley, and which it is the duty of the citizens of Tehama county to interest themselves in, as a new source of revenue.

From Red Bluff to Jelly's Ferry	12
Battle Creek	4
Shingletown	19
Deers Flats	11
Lost Camp	14
Hat Creek	8
Butte creek	14
Pine creek	12
Bridge creek	10
Big Spring	9
Susanville	12
Lathrop's Ranch	20
Mud Spring	16
Smoke Creek	10
Buffalo Spring	14
Deep Spring	16
Granite creek	12
Hot spring	12
Rabbit Hole	20
Antelope Springs	15
Humboldt River	12
Nearest Mines	10
Total	281

The above table was published by us last August. As it is of some importance at the present time we republish it for the benefit of those interested in the new Silverado. Some time since in referring to the distance the types made us state the distance by the new route as one hundred and thirty miles—it should have been two hundred and thirty, which is very near the true distance by the direct route.—*Red Bluff Independent.*

A correspondent from Sonora gives us the following information concerning the Mina Prieta lead, a diagram of which appeared in a late issue of the PRESS; he says:

"There is more movement now in mining interests than ever. A second extension upon the Mina Prieta lead, at San Antonio, has been made within the last month. The announcement was made by F. Rountree, of the firm of Rountree, Bros., Clay street, for himself, brother, and W. W. Tinnier. Col. Redick McKee is also at San Antonio, making examinations with a view to putting up quartz machinery. He expresses himself highly pleased with the appearance of the country—deems it to abound in mineral wealth—but will visit other of the larger districts before fixing upon a locality. I notice that at the Broussas their heavy machinery is ready to commence operations. The demand for good miners is rapidly increasing; even now many could get immediate employment at good wages if they were here."

HUMBOLDT.—Mr. Whitney, who passed through town yesterday, on his way to the Bay, says that the Indians and whites in the Humboldt mines are living on the most friendly terms; and that the boys are extending their ranch and water claims up the river and on all the tributary streams. He also says that there is a large amount of gold and silver bearing rock now lying at the shafts and tunnels in several different districts, the owners of which are waiting for machinery to crush it. The south end of the Humboldt mountains appear to contain almost exclusively gold bearing rock while northward all the quartz contains silver with the gold. Mr. W. is of the opinion that the entire surface of the south end of these mountains will be sluiced off whenever water can be obtained, on account of the rich deposits of gold therein. It has been known for some time that gold existed there in paying quantities, but the want of water has prevented working any part of the rich placers. It would not surprise us if many persons who are about to rush off to Salmon river would finally bring up in the Humboldt mines.

MINERAL OIL IN CANADA.—From the latest advices from Canada, it appears that she is likely to rival the United States in the richness of her mineral oil springs. The chief location at present explored is near the Wyoming station of the Great Western of Canada Railway, but the twelve miles between the wells and the railway will afford an ample field for the enterprise of the traction engine companies, for the roads are extremely bad. Notwithstanding the difficulties of transit, however, there are one hundred wells in full activity, and although the oil-bearing strata are somewhat deeper than in the United States, the pumping of the oil still leaves a very considerable profit. The mode of extraction employed is much the same as in the States. The fortunate owners of the soil, beneath which the oil is found, are reaping abundant harvests, and charging exorbitant rates for the privilege of working—£60 down, and one-third royalty is a common charge. But the cost of the wells is very small, which to an extent compensates for this—sinking through the country being readily taken up by contract at about three pounds per fathom, and drilling through the rock at two pounds ten shillings. A return in the shape of oil commences about a month after operations begin, and a capital from one hundred to two hundred pounds generally suffices. It is estimated that the cost of the oil, including all incidental expenses, does not exceed a halfpenny per gallon, which of course, will leave a large margin for profit.—*London Mining Journal.*

IN LUCK.—A German engaged in mining on North Ravine found, one day lately, a chunk of gold weighing thirteen and a half ounces. We predict that many big pieces will be found after the heavy rains are over, in the vicinity of the Auburn mining district.—*Advocate.*

CAMPENE.—The greatest want, from all accounts, of our neighbors in the mining regions is camphene, which sells readily at Murphys, San Andreas and Angels, for \$7 per gallon.—*Stockton Ind.*

NO PLACER MINES IN SONORA.—Mr. Chas. Buckoser has just returned to Los Angeles county, from the State of Sonora, where he spent a long time in prospecting for placer mines without success. He says there are no paying placer gold mines in that State, notwithstanding extravagant accounts to the contrary.

REMOVAL.

We beg to inform our Friends and the Public, that we have REMOVED TO THE LARGE STORE, No. 419 Montgomery street, Near California, (Lecount's Building)

Thankful for past patronage, we respectfully solicit a continuance of the same.

A. ROMAN & CO.,
Booksellers, Importers and Publishers,

FOR SALE.

TEN DOLLAR LOTS; also 50 Vara Lots, and entire blocks of beautiful Garden land, on the line of the San Jose Railroad, at the West End Depot. Title perfect,—being held under a patent from the United States. Office No. 19, third floor of Naglee's Building, at the southwest corner of Merchant and Montgomery streets.

San Francisco Jan. 27, 1862.

HARVEY S. BROWN.
Fe15.

W. BOHM'S BUCKLE INVENTION.

I desire to call the attention of the public to my late invention in the construction of

A NEW STYLE OF LADIES' BUCKLES,

for which I have applied for Letters Patent. It is by far the most beautiful ornament now in existence. In the *MINING AND SCIENTIFIC PRESS* a full description appeared. Messrs. Bravermann & Levy, 621 Washington street, have a complete assortment of all shapes and embellishments. Their cost is no more than the old style, and their simplicity and ease of adjustment considerably enhances their value. (Go and examine them!)

Bravermann & Levy,
621 Washington street, for W. Bohm.

WILLIAM L. DUNCAN, NOTARY PUBLIC,

—AND—

REAL ESTATE AGENT.

OFFICE,

In Telegraph Office, Montgomery Block.

REAL ESTATE for sale in all portions of the city. Loans negotiated on Real Estate and other securities. Deeds, mortgages and Bonds, accurately drawn up. Soldiers' Pay Claims made out and purchased on liberal terms; and claims against the United States and State Governments collected. Feb1.

SPECIAL NOTICE.

Highly Important Invention is DENTISTRY.—Dr. D. STEINBERG begs leave to announce to the citizens of this city, that letters patent for his invaluable improvements in mechanical Dentistry were granted him on the 12th of November last.

This invention consists in the application of GUM ENAMEL to gold plates for artificial teeth, and are acknowledged to surpass all others in use, for their beauty, style and exactitude of fit; their weight compared with others, is less but are far more durable by the addition of the gum enamel. Specimens of this valuable invention may be seen and examined at the dental office of the undersigned, No. 618 Washington street, near Kearny. Great care and attention is devoted to the perfect filling of teeth. Teeth extracted by the benumbing process.

STEINBERG & Sichel,
Practical Dentists,
618 Washington st., near Kearny.

ROYAL HOTEL.

VICTORIA, V. I.

JAMES WILCOX PROPRIETOR.

THE ABOVE HOTEL is conducted on the most improved principles; is situated on Wharf street; of easy access to all new arrivals, being in the immediate neighborhood of all the wharves. The proprietor begs to inform the miners of California and traveling public, who intend to visit Victoria, that he has superior accommodations for single and married persons, or families, with or without board.

Guests entertained at the following rates: Board per week six dollars. Board and Lodgings, \$8; Board per day, \$1; Lodgings 50 cents. The Bar is furnished with Wines, Spirits, Malts, Liquors, Cigars &c., all of the best quality.

N. B.—The Building is Fireproof.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. IV.

SAN FRANCISCO, SATURDAY, FEBRUARY 22, 1862.

NO. 23.

We herewith present our readers a plat of what are considered the more valuable claims in the Whitman coal field, Nevada Territory, as the same were surveyed by Francis Tagliabue, Esq., late county surveyor, of Lyon County. These claims consist of one hundred and sixty acres each, and have been taken up by present holders under the laws of Utah Territory, the possessory title being further established by the local mining laws in existence. These coal mines, the value of which is now well established, are situated in the Pine Nut Range of Mountains, as described by us in our issue of Feb. 1st. We see by the Nevada papers that a large amount of coal is now being raised from these mines, and that it is coming into very general use in the quartz mills, being found well adapted for making steam. It is also to be employed for lighting Virginia city with gas, works having been erected for that purpose, based upon the value of this coal. This coal belt,

as will be seen by our diagram, extends about five miles in a southeast and northwest direction, being about two miles wide. The outcroppings are formed along the sides of the deep ravine known as Carbondale, indicating that all the veins through which it runs are equally valuable, the Whitman being better thought of simply because more opened than the others.

We will publish in our next week's a diagram illustrating the manner in which the Whitman claim has been opened, showing also the geological character of the strata passed through, from which it will be seen that the latter are quite similar to those in the Mount Diablo coal region, as indeed they are in many respects to those of every carboniferous range. Further explorations recently made prove that all these coal seams concentrate at a moderate depth, composing one heavy body of coal, lying nearly horizontal, and of a much better quartz than that taken out near the surface.

Capital now is alone required to open these valuable mines in a proper manner, and to render them a source of immense profit to both the proprietors and the country at large. It is proper in this connection to state, that although there are reports of coal having been found in El Dorado Cañon and other localities near Dayton, these are all without any good foundation. It appears too that certain parties are seeking to take advantage of the now well ascertained value of the Whitman mines, to palm off upon the public these worthless claims elsewhere located. The Whitman and adjacent claims are to all others, what the Comstock lead was in the early day to the Wild Cat ledges, that were made to sell by virtue of its great value. The Whitman ground and some twenty claims above it, mostly to the northwest, are vastly valuable; but beyond these, not

PLAT OF THE WHITMAN COAL MINES. N. T.

enough is yet known of the coal lands to warrant a definite opinion as to their present or prospective worth.

Explanation to Plate.

1, Laforge; 2, Powers; 3, Lewis; 4, Dorsey; 5, H. De-groot; 6, F. Tagliabue; 7, D. L. Mulford; 8, S. A. Barstow; 9, McCurdy; 10, R. Hardy; 11, N. S. Bowen; 12, W. Beauchamp; 13, E. Aylsworth; 14, H. H. Whitman; 15, G. W. Whitman; 16, I. R. Wells; 17, H. Millington; 18, S. H. Marlette; 19, G. Aylsworth; 20, J. Macnib; A, Butte Sulphur Spring; B, Shaft; C, Rock Spring; D, Shaft; E, Shaft; F, Sulphur Spring; G, Tunnel; H, Indian Spring; I, Wagon Road to Dayton, 7 miles; J, Wagon Road to Virginia, 13 miles; K, Trail to Whitman's Canyon.

GOLD IN THE SANDWICH ISLANDS.—The Honolulu Advertiser of the 2d inst. says: We hear that a piece of placer gold was found a few days since in the crop of a turkey, raised in one of the valleys back of Honolulu, which was killed for a Christmas dinner. We have not seen the piece, but those who have are quite enthusiastic over the discovery, and the question now is, have we gold in our mountains?

DISCOVERY OF ANTIQUITIES.—It is reported from Constantinople, that two French artisans, on a hunting excursion near the city, lately, discovered a most valuable collection of ancient armor and weapons, with a great quantity of gold and silver coins, and some thirty or forty Greek and Latin manuscripts, in perfect preservation. The treasures have been shipped to France.

NEW DIGGINGS.—It is said that new diggings have been discovered along the base of the Blue Mountains, between Jacksonville and Salmon River, which pay from twenty-five cents to one dollar and a half to the pan.

TRUCKEE MINING DISTRICT.—It will be remembered that Mr. O'Conner came out from London last fall, procured some quartz from the above named district, and immediately returned to England. We now learn that the rock assayed so well that orders have been sent out to open the Company's claims by tunneling, and funds have been sent with specifications for building a quartz mill on the Truckee river, about one and a half miles above Stone's Crossing. This mill will be one of very superior construction, and will run about twenty-four stamps; the mines are situated about four miles northwest from the mill site, and the road will be a gentle down-hill grade all the way. The Company's tunnel is now in about seventy feet, and will be prosecuted and the lode opened in as short a time as possible. Other claims in the Truckee District are said to be very promising, but the claimants are generally poor and unable to develop their mines at an early day.

MATTESON'S WATER WHEEL.—Matteson, the discoverer of the hydraulic process of mining, it is well known, is also the inventor of a water wheel, of singular but simple construction, which has hitherto been applied as a power, with hydraulic pressure, to the working of derricks. The other day, at French Corral, we had the pleasure of witnessing a new application of the same power, in the extensive mining claims of Mr. Jere Pollard. These claims, as the bed rock is approached, developed broad belts or strata of cement, so impervious as to resist not only the action of the waters, but even of the crowbar and pick. The amount of gold it contains is trifling, but it is necessary it should be broken up, and sluiced out of the way. To effect this purpose, and also to provide a means of pulverizing much of the pay dirt, also hard and unyielding in its nature, Mr. Pollard conceived the idea of introducing stampers into his diggings, with the Matteson hydraulic wheel attachment. The first experiment, which we were fortunate in witnessing, although made under a number of adverse circumstances, was satisfactory in the extreme. The water was passed into the wheel through a hose of about six inches in diameter, with a fall of about sixty feet, and with that pressure, revolved it with a velocity truly surprising. Five stamps are used, and the aggregate of strokes made, is insured to be three hundred per minutes.—*San Juan Press.*

TAX ON MINING PROPERTY.—Some fear is anticipated that the cow counties will make a separate effort this winter to have mining claims taxed. These farming people are considerably down on paying so much tax. They should remember that it is the mines that gives them customers, or what is better, hard cash.—*Trinity Co. Jour.*

Humbog Creek, during the present summer, will pay better than it has for several years, resulting from the vast amount of ground sluicing which has been done by the heavy freshets. Hungry creek also will pay well, at least from six to ten dollars a day to the hand.

Gold.

This metal is distinguished by its splendid yellow color; its great density = 19.3 compared to water 1.0; its fusibility at the 32d degree of Wedgewood's pyrometer; its pre-eminent ductility and malleability, whence it can be beat into leaves only 1-282,000 of an inch thick; and insolubility in any acid menstruum, except the mixture of muriatic and nitric acids styled by the alchemists aqua regia, because gold was deemed by them to be the king of metals.

Gold is found only in the metallic state, sometimes crystallized in the cube, and its derivative forms. It occurs also in threads of various sizes, twisted and interlaced into a chain of minute octahedral crystals; as also in spangles or roundish grains, which, when of a certain magnitude are called pepitas. The small grains are not fragments broken from a greater mass; but they show from the flattened ovoid shape and their rounded outline that this is their original state. The specific gravity of native gold varies from 18.3 to 17.7. Humboldt states that the largest pepita known was one found in Peru, weighing about twelve kilogrammes (twenty-six and a half pounds avoird.); but masses have been quoted in the province of Quito which weighed nearly four times as much.

Another ore of gold is the alloy with silver, or argental gold, the electrum of Pliny, so called from its amber shade. It seems to be a definite compound, containing in 100 parts 64 of gold and 36 of silver.

The mineral formations in which this metal occurs are the crystalline primitive rocks, the compact transition rocks, the trachytic and trap rocks, and alluvial grounds.

It never predominates to such a degree as to constitute veins by itself. It is either disseminated, and as it were impasted in stony masses, or spread out in thin plates or grains on their surface, or lastly, implanted in their cavities in the shape of filaments or crystallized twigs. The minerals composing the veins are either quartz, calc spar or sulphate of baryta. The ores that accompany the gold in these veins are chiefly iron pyrites, galena, blende, and mispickel (arsenical pyrites).

In the ores called auriferous pyrites, this metal occurs either in a visible or invisible form, and though invisible in the fresh pyrites becomes visible by its decomposition; as the hydrated oxide of iron allows the native gold particles to shine forth on their reddish-brown ground, even when the precious metal may constitute only the five-millionth part of its weight, as at Rammelsberg in the Harz. In that state it has been extracted with profit; most frequently by amalgamation with mercury, proving that the gold was in the native state, and not in that of a sulphuret.

Gold exists among the primitive strata, disseminated in small grains, spangles and crystals. Brazil affords a remarkable example of this species of gold mine. Beds of granular quartz or micaceous specular iron, in the Sierra of Cocae, twelve leagues beyond Villa Rica, which form a portion of a mica-slate district, include a great quantity of native gold in spangles, which in this ferruginous rock replace mica.

Gold has never been observed in any secondary formation but pretty abundantly in its true and primary locality among the trap rocks of igneous origin: implanted on the sides of the fissures, or disseminated in the veins.

The auriferous ores of Hungary and Transylvania, composed of tellurium, silver pyrites or sulphuret of silver, and native gold, lie in masses or powerful veins in a rock of trachyte, or in a decomposed felspar subordinate to it. Such is the locality of the gold ore of Konigsberg, of Telkehanya, between Eperies and Tokay in Hungary, and probably that of the gold ores of Kapuick, Felsobanya, &c., in Transylvania; an arrangement nearly the same with what occurs in Equatorial America.

The auriferous veins of Guanaxuato, of Real del Monte, of Villalpado, are similar to those of Schemnitz in Hungary, as to magnitude, relative position, the nature of the ores which they include, and of the rocks they traverse. These districts have all mineralogists with the evidences of the action of volcanic fire. Breislak and Hacquet have described the gold mines of Transylvania as situated in the crater of an ancient volcano. It is certain that the trachytes which form the principle portions of the rocks including gold, are now almost universally regarded as of igneous or volcanic origin.

It would seem, however, that the primary source of the gold is not in these rocks, but rather in the sienites and greenstone porphyries below them, which in Hungary and Transylvania are rich in great auriferous deposits; for gold has never been found in the trachyte of the Euganean mountains, of the mountains of the Vicentin, of those of Anvergne; all of which are superposed upon granite rocks, barren in metal.

Finally, if it be true that the ancients worked mines of gold in the island of Ischia, it would be another example, and a very remarkable one, of the presence of this metal in trachytes of an origin evidently volcanic.

Gold is, however, much more common in the alluvial grounds, than among the primitive and pyrogenous rocks just described. It is found disseminated under the form of spangles, in the silicious, argillaceous, and ferruginous sands of certain plains and rivers, especially in their re-entering angles, at the season of low water, and after storms and temporary floods.

It has been supposed that the gold found in the beds of

rivers had been torn out by the waters from the veins and primitive rocks which they traverse. Some have even searched, but in vain, at the source of auriferous streams, for the native bed of this precious metal. The gold in them belongs, however, to the grounds washed by the waters as they glide along. This opinion suggested at first by Delius and supported by Dehorn, Guettard, Robitant, Balbo, &c., is founded upon just observations.

1. The soil of these plains contains frequently, at a certain depth and in several spots, spangles of gold separable by washing.

The greater part of the auriferous sands, in Europe, Asia Africa and America, are black or red, and consequently ferruginous; a remarkable circumstance in the geological position of alluvial gold. M. Napione supposes that the gold of these ferruginous grounds is due to the decomposition of auriferous pyrites. The auriferous sand occurring in Hungary almost always in the neighborhood of the beds of lignites, and the petrified wood covered with gold grains, found buried at a depth of fifty-five yards in clay, in the mine of Vorospatak near Abrabanya in Transylvania, might lead us to presume that the epoch of the formation of the auriferous alluvia is not remote from that of the lignites. The same association of gold ore and fossil wood occurs in South America, at Moco. Near the village of Lloro, have been discovered at a depth of twenty feet, large trunks of petrified trees, surrounded with fragments of trap rocks interspersed with spangles of gold and platinum. But the alluvial soil affords likewise all the characters of the basaltic rocks; thus in France, the Ceze and the Gardon, auriferous rivers, where they afford most gold, flow over ground apparently derived from the destruction of trap rocks, which occur in situ higher up the country.

2. The beds of the auriferous rivers and streamlets contain more gold after storms of rain upon the plains than in any other circumstances.

3. It happens almost always that gold is found among the sands of rivers only in a very circumscribed space: on ascending these rivers their sands cease to afford gold; though did this metal come from the rocks above, it should be found more abundantly near the source of the rivers. Thus it is known that the Oro contains no gold except from Pont to its junction with the Po. The Ticino affords gold only below the Lago Maggiore; and consequently far from the primitive mountains, after traversing a lake, where its course is slackened, and into which whatsoever it carried down from those mountains most have been deposited.

The Rhine gives more gold near Strasberg than near Basle though the latter be much closer to the mountains. The sands of the Danube do not contain a grain of gold, while this river runs in a mountainous region; that is from the frontiers of the bishopric of Passau to Efferding; but its sands become auriferous in the plains below.

The same thing is true of the Elms; the sands of the upper portion of this river, as it flows among the mountains of Styria, include no gold: but from its entrance into the plain at Steyer, till its enlanchure in the Danube, its sands become auriferous, and are even rich enough to be washed with profit.

Mining as an Investment.

Metallic ores are usually found in lodes or veins following a given direction, and intersecting the strata at greater or less angles. In some cases, however, such deposits are interfoliated between the lamina of the beds constituting the strata.

A lode intersecting the cleavage of the strata is generally spoken of as a true vein. It may be of indefinite length and depth, and has commonly a greater or less inclination with the meridian. Its composition is usually different from that of the enclosing rock. The distance between its two walls is called the width or thickness of a vein, and may vary considerably. In Europe a metalliferous vein is considered wide if it exceeds five or six feet in thickness. The deposits of ore occurring in veins are extremely irregular, forming masses of very diversified forms and extent, separated from each other by intervening patches of veinstone, which may be either entirely devoid of mineral, or otherwise mixed with inconsiderable quantities of finely divided ore.

In mountainous districts veins are often explored and worked by means of galleries driven from adjacent valleys. In this way the ground is unwatered, and a direct communication established between the different workings in the mine. When the conformation of the country will not admit of a deep gallery of this kind, the explorations are carried on by means of shafts drained by machinery. This is effected by sinking one or more main shafts, and fixing pump-work to remove such water as may be met with during the progress of operations. Galleries right and left of the shafts are then extended at vertical intervals of about 60 feet, and any ore existing between the various levels subsequently stoped out, whilst the sinking of the shaft is continued in proportion as the workings advance.

The uncertain nature of metalliferous mining affords unusual facilities for making unscrupulous misrepresentations, and consequently whenever, through the abundance of money or other favorable causes, the public mind becomes credulous, it admits the grossest misstatements without examination, and readily consents to pay exorbitant sums for properties which are, probably, altogether worthless, or at least of but little intrinsic value. Sooner or later, however

the truth is arrived at, and, under the influence of a violent reaction, an industry that deserves well is denounced as a delusion, whilst the real circumstances producing the evil are either slurred over or forgotten.

It is often asked if mining, on the whole, is a profitable industry. It may be replied that it is not only profitable but largely so, provided caution and judgment be exercised in selecting the mines, and due integrity, skill and economy, displayed in their management. If, however, these conditions be not fulfilled, the most disastrous consequences may be anticipated; since worthless undertakings will in this case be supported by the public, and after subscribers have paid extravagant premiums for indifferent properties, the capital necessary to develop them will either be squandered or injudiciously spent.

It would be, perhaps, difficult to conduct mining operations to any considerable extent without such a division of interest and contribution of means as to diminish, in a great degree, the pressure which must be individually felt where the number of shareholders is small. It is, however, questionable whether it be prudent to extend the number of shares beyond a reasonable limit; since it is evident that reduction of price must tend to create an undue traffic in them, and their value is consequently made to fluctuate rather in accordance with a more or less unhealthy state of public feeling, than with reference to the intrinsic merits of the undertaking itself.

Mining may be classed under two distinct heads, viz.: experimental and profitable. The first comprehends the various researches necessary to establish the presence of metallic ores in remunerative quantities; whilst the second, or profitable mining, includes all properly developed undertakings in which a sufficient amount of ore has been discovered to ensure their being advantageously worked for a more or less extended period.

A capitalist wishing to become associated with a company prosecuting a mining enterprise should first inquire into the honesty and ability of the person reporting on it; and secondly, ascertain if the shareholders generally are in a position to meet the demands which a vigorous trial would be likely to impose on them.

All mineral explorations should be conducted as rapidly as possible, for the purpose of lessening the aggregate amount of dead charges, and a practical, intelligent, and honest man should be entrusted with the direction of the works. It is by no means essential that such a person should possess an elaborate education; but his ideas relative to the exigencies of his profession should be clear and well defined.

Grave mistakes are frequently committed by entrusting the local management of mineral undertakings to men who possess but a superficial acquaintance with the subject, and who sink large sums of money in the multiplicity of their schemes for economizing expenditure; such persons often make extensive surface erections before proceeding to the development of the underground works, and, from mere love of display, absorb an undue proportion of the capital, forgetting that their arrangements can only be valuable in proportion as the mine itself becomes productive. Hence the undertaking becomes prematurely embarrassed, and is sometimes obliged, from this cause alone, to terminate its existence.

In order to afford capitalists a few leading ideas relative to the peculiar features tending to make a mine valuable, we note some points on which distinct information should, if possible, be obtained prior to investment, presuming that, in the first instance, the repute and management of the company, is duly approved.

1. Situation of the mine, and the value of the locality for its specific produce as compared with other mining districts.
2. Relative position of the 'lead' with regard to surrounding profitable mines, whether situated on the run of productive lodes, or parallel to them; and if on the latter, whether the ground in its general characteristics is analogous to that of the productive district.
3. Length and extent of ore ground developed, the dip or run of the metalliferous deposits, and whether they are shortening or lengthening in depth.
4. Estimated quantity of ore in reserve, its average produce, and if increasing or decreasing in its yield of metal.
5. The estimated average cost of bringing the ore to the surface, and an approximate estimate of its value per ton.
6. Works of trial which are in progress, the time required to complete them, and, if successful, to what extent they will enhance the value of the property.
7. Quality and condition of the machinery, its value, amount of surplus power at command, its cost of maintenance as compared with the total mining expenditure, and the estimated amount which may be required for the future.
8. Estimated value of materials, amount of cash in hand, and value of ore ground in reserve, less liabilities, as compared with the present and prospective value of shares.

It is believed that the foregoing considerations will be found to embrace most of the chief points bearing on the value of a mining undertaking; but it is also possible that minor inquiries will be suggested by the answers which may be elicited. These must, however, be pursued according to the discernment and tact of the inquirer, who, from the general tone of the information obtained, will regulate the extent and importance of his intended investment.

Mining Companies and Associations.

Office Gould & Curry Silver Mining Company.—November 5th, 1861. Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the sixth day of December next.

JAS. C. L. WADSWORTH, Secretary.

Office of the Gold and Silver Mining Company, San Francisco, October 19th, 1861.—Notice is hereby given, that at a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one half of which to be made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.

C. S. HIGGINS, Secretary.

Office Bullion Gold and Silver Mining Company, Van Horn District, 305 Montgomery street, San Francisco. Notice is hereby given that the regular annual meeting for the election of officers for the ensuing year will be held at the company's office on the first Monday in December next, at 2 o'clock p. m.

T. L. BURNES, Sec'y.

Notice.—There will be a meeting of the Sides Gold and Silver Mining company, on Sunday, November 17th, 1861, at 11 o'clock a. m., at the house of M. H. Bryan, Virginia City.

A punctual attendance is requested, as business of importance will come before the meeting.

Nov 29

M. H. BRYAN, Sec'y.

GOLD HILL TUNNEL CO.—The meeting called for Saturday, November 9th, is postponed till Thursday, November 14th, 1861. The meeting will be held at the saloon of Webb & Coppers, Gold Hill.

A punctual attendance is requested, as business of importance will come before the meeting.

ROBERT APPLE, Sec'y.

SHAREHOLDERS of the Calaveras Gold and Silver Mining Company are hereby notified that a meeting of the Trustees in Gold Hill, on the 4th inst., an assessment of twelve and one half cents per share was levied on the capital stock of said company, payable on or before the 20th inst., to the Superintendent, at his office in Gold Hill, or to W. M. B. AGARD, San Francisco.

Shareholders failing to pay said assessment at the time required are hereby notified that so much of their respective interests in said company as will be sufficient to pay their several delinquencies, will be sold at public auction in front of the office of Wells, Fargo and company at Gold Hill, on the 9th day of December next.

By order of the Board of Trustees,

Gold Hill, Nov. 4th, 1861.

POSTPONEMENT OF SALE.—The sale of mining ground, at Silver City, by the Kansas Mining company, is postponed until four o'clock, p. m., Tuesday, Nov. 10th, 1861. Sale to take place on the grounds of the company. Delinquents will please take notice and "come to time."

By order of the Board of Trustees.

R. C. CHAMPELL, Sec'y

Office Choller Silver Mining Company, 612 Front street, San Francisco, Nov. 20th, 1861.—The annual meeting of the stockholders of this company will be held at their office in this city, WEDNESDAY, December 4th, 1861, at 11 o'clock A. M.

W. E. DEAN,
Sec'y Choller S. M. Co.

GOLDS GATE COMPANY, GOLD HILL DISTRICT.—A meeting of the shareholders in the above named company will be held at the office of H. O. Gaylord, in Virginia on Saturday, Nov. 16th, at 7 p. m.

T. A. MONKHOUSE, Sec'y.

MEMBERS of the Senator company, Congress Lodge, Devil's Gate District, are hereby notified that an assessment of twenty-five cents per foot was this day levied by the Board of Directors, payable to the Secretary at his office, in Virginia, on or before the 15th day of November, instant.

L. W. FERRIS, Sec'y.

Office of the Cole Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Cole Silver Mining company held Oct. 25th, 1861, an assessment was levied of one-tenth of one per cent on the capital stock of the company, being fifty cents per share, payable within thirty-five days to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.

By order of the Board of Trustees.

J. D. COFFIN, Sec'y.

Office Dios Padre Gold and Silver Mining Company, 215 Front street San Francisco, October 29th, 1861.—A meeting of the stockholders of the Dios Padre Gold and Silver Mining company, held at the office of the company, on Saturday, November 16th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting. By order of the Board of Trustees.

JOS. P. NOURSE, Secretary.

Office Rogers' Silver Mining Company, San Francisco, October 15th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 15th day of November, 1861, at the office of the company, in this city.

By order of the Board of Trustees.

JOEL F. LIGHTNER, Secretary.

Office of the Sucker Gold and Silver Mining Company, Nos. 1 and 2, Montgomery Block, San Francisco, California.—Notice is hereby given that the annual meeting of the Stockholders of the Sucker Gold and Silver Mining Co., will be held at the office of the Company, Nos. 1 and 2 Montgomery Block, on the first Monday after the first Tuesday of January, A. D. 1862, at ten o'clock A. M. of that day, for the election of Trustees, and for the transaction of other business.

By order of the Trustees.

R. H. WALLER, Secretary.

Notice is hereby given to the members of the Arizona company, that there will be a meeting of said company held at the Recorder's office, in Virginia city, N. T., on Saturday the 23d inst., for the purpose of organizing said company. All delinquents are notified that unless their assessments are paid by said date, their interest in said company's claims will be sold to pay the same.

R. T. SMITH,
President Arizona Company.

Office of the Desert Mining company, 509 Montgomery street, San Francisco, Nov. 23d, 1861.—The stockholders are hereby notified that an assessment of one dollar per share on the capital stock of the Desert Mining company, has this day been levied, payable on or before the 28th day of Dec. next, at the offices as above.

By order of the Board of Trustees.

J. H. LYON, Sec'y.

Notice.—The regular annual meeting of the stockholders of the Cedar Hill Tunnel and Mining Company, will be held at the office of the Secretary, on Thursday, January 2d, 1862, at 7 o'clock, p. m., for the election of officers for the ensuing year, and such other business as may come before the meeting.

San Francisco, December 24, 1861.

C. L. FARRINGTON, Sec'y.

Office of the (Ross District) Union Gold and Silver Mining company, San Francisco, Dec. 13th, 1861.—The stockholders are hereby notified that an assessment of ten cents per share on the capital stock of the Union Gold and Silver Mining company was levied on the 12th inst., payable on or before the 15th of January, 1862, at the office of the company, 410 Montgomery street.

By order of the Board.

C. J. HIGGINS, Sec'y,

Notice is hereby given that an assessment of One Dollar per foot (share) has this day been levied on the ground at the Alhambra Mining company, payable at the office of the company, 515 Sansome street, San Francisco.

By order of the Trustees.

J. O. STRAUCH, Secretary.

November 24th, 1861.

Office Ophir Silver Mining Company, San Francisco, Nov. 20th, 1861.—The Annual meeting of the Stockholders of this company will be held at their office in San Francisco, on Wednesday, December 11, 1861, at 11 o'clock, a. m., for the election of officers for the ensuing year, and transactions of such other business as may be presented.

JAS. W. WHITE, Sec'y

ADRIATIC CO.

POSTPONEMENT OF SALE.—Delinquent stockholders are hereby notified that the sale of delinquent stock advertised to be sold on November 10th, has been postponed until Thursday the 21st inst., at which time all delinquent stock will positively be sold in front of the Secretary's office, at 1 p. m.

By order of the Board of Trustees.

JOHN G. GILCHRIST, Sec'y.

Virginia city, November 10th, 1861.

A Meeting of the shareholders of the Summit company will be held at the Gold Hill Bldg. in Gold Hill, on Friday, Nov. 15th, at 7 o'clock p. m. A punctual attendance of the shareholders is requested, as business of importance will be transacted. By order of the President.

JOHN DOHLE.

SAVAGE Gold and Silver Mining company. A meeting of the stockholders in the above company will be held at 10 o'clock, a. m., the 17th day of December 1861, at the office of Lent, Sherwood & Co., in this city, for the transaction of important business. Parties claiming an interest in the above company will please hand in an abstract of their title either to Robert Morrow at Virginia city, to A. K. Head Nevada, or the undersigned before the 14th day of December next.

WM. M. LENT, President.

San Francisco, November 27, 1861.

Office Crown Point Gold and Silver Mining company, 321 Front st., San Francisco, Oct. 28th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees, will be held at the office of the company, on Wednesday, November 20th, at one o'clock P. M.

O. B. CRARY, President.

Office Crown Point Gold and Silver Mining Company, 321 Front street San Francisco, Nov. 6, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining company has this day been levied, payable on or before the 10th of December next, at the office, as above.

J. H. JONES, Sec'y.

Office Sierra Nevada Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 28th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City; or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees of S. N. S. M. Co.

J. H. BREWER, Secretary

Office of the Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that all stocks on which assessments are now due, and unpaid after thirty days from date, will be advertised and sold, according to the laws of California and the By-Laws of the company. All parties holding stock of this company are requested to hand it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees.

JOSH. S. HENSHAW, Sec'y.

Office of Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty-sixty or ninety days (from date), to the Treasurer of the company.

By order of the Board of Trustees.

JOSH. S. HENSHAW.

Notice.—A general meeting of stockholders, of the New Idria Mining Company will be held at the offices of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.

By order of the Board of Trustees.

HENRY S. HUDSON, Sec'y.

San Francisco, Nov. 8, 1861.

Notice.—The annual meeting of the Charles Cany mining company, will be held at the office of the company (D. Davidson's room, northeast corner of California and Montgomery street, San Francisco) on Friday Dec. 27th, A. D. 1861, at 3 o'clock, p. m. of that day, for the election of officers for the ensuing year, and transaction of such other business as may be presented. A punctual attendance of all stockholders is requested.

By order of the Board.

ALEX. FLY, President.

Office of Sucker Gold and Silver Mining company.—Notice is hereby given that the Board of Trustees of this company (formerly the Sucker company, Gold Hill District), have this day, Tuesday, Nov. 19, 1861, duly levied an assessment of fifty cents upon each share of the capital stock of their company, in said company, payable immediately to the Secretary, at their office, Nos 1 and 2 Montgomery Block, San Francisco, or to J. A. Hobart, Trustee at Gold Hill, Nevada Territory. On default of payment of which assessment for thirty days after publication of this notice, all delinquent stock and ownership will be sold according to law, and the rules and By-laws of the company.

R. H. WALLER, Sec'y.

Notice.—Notice is hereby given, that Jos. J. DuPrat is the only authorized agent in California, U. S. of America, for the silver mines known as "Mina Rica," "Guanahua," "Fortune," "Santa Cruz," and "Nacimiento," situated near San Antonio, Lower California, Mexico.

CHAS. J. DUPRAT,

EM. LEYA,

DUPRAT, SCHMITZ & CO.,

CHAS. KRAFT & CO.,

La Paz, Lower California, July 30th, 1861.

For the purposes of reference, the Deeds of the above named mines have been recorded in the city and county of San Francisco, State of California. For further particulars respecting the above named mines, inquire of J. J. DUPRAT, 423 Washington street.

Office of the Bullion Gold and Silver Mining Company, 410 Montgomery street, San Francisco, Jan. 13, 1862.—Notice is hereby given that at a meeting of the Board of Directors, held on the 11th inst., an assessment of ten cents per share was levied on the capital stock of this company, one half of which is called forthwith.

By order of said Board.

C. S. HIGGINS, Sec'y.

Office Cedar Hill Tunnel Mining company, No. 509 Sacramento street. An assessment of Two hundred and fifty dollars per (original) share has been levied by the Trustees, payable as follows: Twenty per cent. on the 15th of January, and twenty per cent. on the first of each month following until paid in full.

CHAS. L. FARRINGTON, Sec'y.

San Francisco January 14, 1862

Office of the Falls of Clyde Consolidation Gold and Silver Mining Company, New No. 534 Washington street, San Francisco, January 3rd, 1862.—At a meeting of the Board of Trustees of the Falls of Clyde Consolidation Gold and Silver Mining Company, held January 3rd, 1862, an assessment of one eighth of one per cent. on the capital stock of the company—being twelve and one half cents per share—was levied, payable within thirty days from this date, at the office of the company in this city.

W. L. DUNCAN Sec'y.

SHAREHOLDERS of the Osceola Gold and Silver Mining company are hereby notified that the meeting of the Trustees of said company in Virginia city, on the 2nd inst., an assessment of twenty cents a share was levied on the capital stock of said company, payable on or before the 20th instant to the Treasurer, at his office in Gold Hill, or to H. H. Russell, Virginia city. Shareholders failing to pay the assessment at the time required, are hereby notified that so much of their interest in said company as will be sufficient to pay the amount of their delinquencies will be sold at public auction, in front of the saloon of Laddington & Russell, in Virginia city, on Saturday, the 16th day of December next, between the hours of twelve and three p. m.

J. S. WATKINS, Treasurer, Osceola G. & S. M. Co.

Virginia city, Nov. 2, 1861.

Notice to Quartz Miners.

The Union Gold and Silver Mining company having opened their mineral veins in the San Joaquin to an extent satisfying them of the value of the same, and having contracted for the erection of a quartz mill near said holes (not exceeding five miles distant) are now desirous to contract with responsible parties for mining and delivering at an early day, at the said mill, not less than one thousand tons of quartz rock. Proposals will be received until the fourteen day of February next. For further particulars enquire at the Office of the company, 410 Montgomery street, San Francisco.

C. S. HIGGINS, Sec'y.

Office North Potosi Silver Mining Company.—Notice is hereby given, that the Trustees of the North Potosi Silver Mining company, have this sixth day of January, 1862, levied an assessment of one dollar per share upon each and every share of the capital stock of said company, payable on or before the fifteen day of February, 1862, to H. A. Eastman, at Virginia City, or the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees.

J. H. BREWER, Sec'y.

MINEING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers! This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 50. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Lock Box 537, P. O.

Room 24, (formerly) U. S. Court Building, Corner of Washington streets, San Francisco.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....FEB. 22, 1862.

The MINING AND SCIENTIFIC PRESS published is at 522 Merchant bet. Montgomery and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. Having the best legal talent near the Patent Office in Washington City as our associate, we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

THE MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

REMOVAL OF THE "PRESS" AND PATENT AGENCY.

The business of this office having become quite extensive, it therefore made it incumbent upon us to remove from our offices in the Government House, where we had scarcely room enough to do our regular office business. We occupied said premises for nearly two years, and were really loth to leave them. Circumstances have placed us so that we now can enjoy separate offices for the printing of our MINING AND SCIENTIFIC PRESS; and the applicants for letters patent need no longer be interrupted by the thousand and one inquiries heretofore made, while we occupied said offices.

We have moved our printing rooms to Merchant street, No. 522, between Sansome and Montgomery up stairs, and the

PACIFIC PATENT AGENCY

and the Editorial rooms are now eligibly situated in the former U. S. Court Building, northeast corner of Battery and Washington streets, in room 24. All persons having business with us will favor us with a visit as early as convenient. Letters will be addressed to us in accordance with the above.

California Mining Institute Under Way.

The State Legislature being intact so far as the establishing of a mining school is concerned or the expenditure of a dime towards this laudable object, a few enterprising citizens who are zealous for the sciences to be disseminated throughout this coast, have undertaken to establish a school for the several branches requisite. The expenses incurred will not fall short of from four to five thousand dollars, merely for the incidental first outlays, such as the implements, books, apparatuses. The matter is now in the hands of the committee to draft a circular, plans for instruction and rules for governing the institute. Professors for the several branches are yet to be chosen; should the present Board of our State Geological Survey be induced to except the several chairs, it will save considerable expense to the managers, who would from necessity be compelled to send to the Atlantic States or Europe, for which we think there need be no necessity. We feel satisfied that Professor Whitney can find a few hours during the week to lecture before the institute, as do the professors of the Pacific Medical University, whose vocations may be placed in the same category with the gentlemen composing the State Geological Survey. We trust that these gentlemen will except the respective positions offered them; they will thereby reap an emolument emanating from the enterprise, and help to inaugurate an institute long since required in this State.

We have in our midst a number of eager students, who would willingly avail themselves of one or two courses in the various branches taught in such an institute. The tuition or course will not exceed seventy-five dollars, and may con-

tinue from four to five months—two of such courses to be given in each year. An extensive laboratory will be at once provided and the services of an expert chemist has already excepted the position of that branch.

Our Scientific Associations.

We have paid visits to our several scientific associations in this city recently, and find that their unceasing efforts are productive of bringing to light many new and interesting matters for scientific investigations. The new board of officers lately chosen by the Academy of Natural Sciences have infused harmony, interest, and a will on the part of its members to meet regularly and with a desire to be useful. The whole cabinet of this society, of its specimens is undergoing a thorough classification, and will shortly present the finest museum on this coast, including some of the rarest curiosities ever discovered.

The German Society have also been diligently to work, and their meetings are also more regular, since one or two overbearing or otherwise officious members have left it, which we are sorry to say are to be found in most all institutions, whose sole aim is to carry everything before them with a stubborn, knock down argument. Several interesting lectures have been lately read and listened to with profound interest. Their museum, especially the department of ethnology, and ornithology, are the best selection on this side of the Pacific.

We are now preparing a short synopsis for a lecture in German, touching the subject of "Engineering as applied to mining," which we shall be pleased to read to this association.

Exchange of Mineral Specimens.

The proprietor of this journal will take it as a great favor, if Miners, Prospectors, and Assayers; will forward to the address of this paper, duplicate specimens of minerals of peculiar shape, or external appearance, and by giving the name (if possible,) of the locality. We will cheerfully make an exchange therefor, for similar specimens, by selecting from our catalogue; which we will send on application. The mineral cabinet of this establishment, lacks yet some qualities of quartz specimens indigenous to California. We trust that our subscribers and friends throughout the Interior will do us this favor, and forward through the mail or express. Samples about the size of an egg.

Nevada Territory.

A correspondent from Silver City to a cotemporary writes as follows concerning the mines in that vicinity: Silver Mountains is situated in the range of mountains running southeast from the mouth of Carson Canon, and fourteen and a half miles from Woodford's by the Hope Valley route. The road runs by Hawkins' Ranch, till you strike the mountain path. In summer time it is very easy of access, and cheap to get to, but in winter time it is a pretty hard road to travel, notwithstanding which many are going and coming all the time from Virginia, Carson etc. The ledges opened are very rich, and promise fair returns to the enterprising men who left Virginia and Gold Hill, and are striking to it even in the dead of winter, well knowing there is bright prospects ahead as soon as the spring opens. There is abundance of water in every canon where mills can be erected, for quartz and saw purposes. Fine water powers can and have been taken up already for various purposes. We are forty miles from the famous Mammoth (Peck's) in a southwest direction, and its location bids fair to have a good share of attention next spring.

The Mountain ledge and mountain ranks A No. 1. The rock being something similar to that of the Orpbir and Virginia City. I have seen the assays of it 672:10, 860:73 silver per ton. The ledges taken up on the mountain (tunnel 60 feet), Scandinavian 30 feet, Baltimore 50 feet, Emma Francis 45 feet tunnel, Lincoln Ledge, the Washington, Silver Prize, Yellow Jacket, Patagonia, San Francisco, all silver. The O'Mann ledge, discovered last fall is the only gold one yet discovered.

The Mann Company have been working all summer, and struck it rich. They say that it is the same as the Gold Hill Rock. Some of it was assayed by Joe French, of Virginia City, and it went as high as \$962 per ton. The Lady Davis Company, on the same ledge is good, and will pay well. In silver, the assays from both it and the San Francisco were good. Van Horn, an old Mexican miner is getting machinery for a saw mill and quartz mill, to be put up early in the spring, weather permitting. Others are making arrangements with the capitalists in Virginia to come and put up mills.

Mining Companies and Associations.

The following bill concerning associations and companies has been recommended by the Committee on Mines and

Mining Interests now before both houses will prove interesting to our patrons. It is a substitute for the Assembly bill No. 6, lately introduced:

SECTION 1. Whenever any number of persons shall be associated in the ownership and working of mining claims in this State, otherwise than as a corporation, the person or persons owning or representing a majority of the shares or interests shall have the power to prescribe the manner of working such claim or claims, and to make, declare and levy assessments to defray the necessary expenses of working the same; provided that the assessments so levied shall be equal and uniform, and proportionate to the share or interest of each stockholder, and not exceed the amount required for the working thereof; and provided, further, that no assessment shall be made, declared, or levied, at a regular meeting of the company or association, or at a meeting specially called for that purpose, due notice of which shall have been given to each stockholder or person representing him; of which meeting a record shall be kept in a company, and the minutes of the meeting showing the business transacted, shall be certified and signed by the clerk or person acting in his place: they shall also have power to appoint a foreman or superintendent to conduct and control the work, to collect the assessments and perform such other duties as the company may direct.

SEC. 2. If any member of such association or company, or any joint owners of a mining claim, or a share therein, shall refuse or neglect to contribute his proportion of the expenses of working the same, or shall fail or neglect to pay the amount assessed against him, for the space of thirty days after such assessment shall have been made, it shall be lawful for the foreman or superintendent, when so directed by a majority of the stockholders, in the name and to and for the use of such company, to institute and maintain an action against the delinquent in any court of competent jurisdiction for the recovery of the amount due, and such action shall not be deemed to work a dissolution of such association or company.

SEC. 3. The shares or interests of any person who shall be a member of a mining company or association, are hereby liable to the company for all amounts assessed upon such shares or interests, and for all sums owing by such member to the company on account of the working of the joint claims, and such company shall have a lien upon such shares or interests to secure the amount so due, which lien shall continue and be in force until the same is paid and satisfied.

SEC. 4. Whenever the owners or shareholders representing a majority of the shares or interests in any such mining company or association shall have made and declared an assessment upon the members thereof, the foreman or superintendent of such company or association, when directed by a majority thereof, shall file the statement, duly verified by himself or a member of the company, in the office of the Recorder of the county where the claims of such company are situated, claiming in behalf of such company or association to hold a lien upon the share or interests of each delinquent member. Such statement shall contain the name of each delinquent, the extent of his share or interest of the company, and the amount by him to the company. It shall also briefly describe the mining claims of the company or association, and shall give the date of the assessment upon each member. The Recorder shall record such statement in a book to be by him kept for that purpose; from and after the filing of such statement it shall operate as notice to third parties, and the lien of such company shall be valid and binding against all subsequent purchasers of such share or interests and shall take precedence of all subsequent judgements and executions against such delinquent upon his individual liabilities.

SEC. 5. The court in which any action should be instituted for the recovery of assessments, as provided in section two, may, in addition to a judgement to the amount ascertained to be due to the association or company, further direct and order that the share or interest of the delinquent be sold in the manner prescribed by law for sales on execution, and that the proceeds of such sale shall be applied to the satisfaction of such judgement and the costs thereon, and the residue of such proceeds, after satisfying the judgment and costs shall be paid to the delinquent or his legal representatives.

SEC. 6. Any mining association or company may, by vote of its members representing a majority of shares in said mining company or association, adopt rules and regulations, not inconsistent with the Constitution and laws of this State, for its government; such rules and regulations may fix and limit the liability of members as between themselves, but shall not in any manner effect the liability of such members to third parties, which said rules and regulations shall be entered in full in a bound book to be kept by the company or association.

SEC. 7. In all suits arising under this Act between the members of mining companies or associations for the collection of assessments, the members thereof shall be legal and competent witnesses by complying with the provisions of existing laws.

SEC. 8. No shareholder in any mining company or association in this State shall be held liable under the provisions of this Act, unless he shall agree in writing to be so held.

Napier's Secret Inventions.

CONSTINE & CO., FURNITURE FACTORY.

ENGINE ROOM.

Few of the results of speculative science have been so soundly appreciated as the invention of Logarithms, by John Napier, early in the seventeenth century. His ingenious and contriving mind did not, however, rest satisfied with these pursuits; for a paper with his signature, which is preserved in the library at Lambeth Palace, ascribes him to be the author of certain "secret inventions, profitable and necessary for the defense of this island, and withstanding of strangers, enemies to God's truth and religion." Of these the first is stated to be a Burning Mirror, for burning ships by the sun's beams, of which Napier professes himself able to give to the world the "invention, proof, and perfect demonstration, geometrical and algebraical, with an evident demonstration of their error who affirm this to be made a parabolic section." The second is a mirror for producing the same effect by the beams of a material fire. The third is a piece of artillery, contrived so as to send forth its shot, not in a single straight line, but in all directions, in such a manner as to destroy everything in its neighborhood. Of this the writer asserts he can give the invention and visible demonstration. The fourth and last of these formidable machines is described to be a round Chariot in metal, constructed so as both to secure the complete safety of those within it, and moving about in all directions, to break the enemy's array by continual charges of shot of the arquebuse through small holes. "These inventions," the paper concludes, "besides devices of sailing under water, and divers other devices and stratagems for harassing the enemies, by the grace of God and work of expert craftsmen, I hope to perform." John Napier of Merchiston, anno dom. 1596, June 2.

From this date it appears that Napier's head had been occupied with contrivances here spoken of long before he had made himself known through those scientific labors by which he is now chiefly remembered. Some of his announcements are so marvelous as to lead us to suppose that he intended in this paper rather to state what he conceived to be possible than what he had himself actually performed. Yet several of his expressions will not bear this interpretation, and others confirm what he asserts as to his having really constructed some of the machines he speaks of. Thus Sir Thomas Urquhart, in a strange work, "The Jewel," first published in 1652, evidently alludes to the third invention as an almost incomprehensible device; adding, "it is this: he had the skill (as is commonly reported) to frame an engine (for invention not much unlike that of Archytas's dove) which, by virtue of some secret springs, inward resorts with other implements and materials fit for the purpose, inclosed within the bowels thereof, had the power to clear a field of four miles in circumference of all the living creatures exceeding a foot of height that should be found thereon, how near soever they might be to one another; by which means he made it appear that he was able, with the help of this machine alone, to kill thirty thousand Turks without the hazard of one christian.

Of this it is said upon a wager he gave proof upon a large plain in Scotland, to the destruction of a great many cattle and flocks of sheep, whereof some were distant from others half a mile on all sides, and some a whole mile." Little faith is attached to this statement, that Napier actually put the power of his machine to the proof; but taken in conjunction with Napier's own account, it seems to prove that he had imagined some such contrivance, and even that his having done so was matter of general notoriety in his own day, and some time after. It should be added that although Sir Thomas Urquhart was born in 1613, some years before Napier's death, The Jewel was not published until 1652, some years after the reputed inventor's decease. Urquhart informs us that Napier, when requested on his death bed to reveal the secret of this engine for destroying cattle, sheep and Turks, refused to do so, on the score of there being too many instruments of mischief in the world already for it to be the business of any good man to add to their number.

There is a common report among the people at Gartness, that this machine is buried in the ground near the site of the old castle said to have been occupied by Napier.

An able writer in the Philosophical Magazine, vol. xviii., has collected several notices of achievements similar to those which the Scotch mathematician is asserted to have performed. In regard to the mirror for setting objects on fire at a great distance by the reflected rays of the sun, he adduces the well known story of the destruction of the fleet of Marcellus, at Syracuse, by the burning glasses of Archimedes; and the other (not so often noticed) which the historian Zonaras records, of Proclus having consumed by a similar apparatus the ships of the Scythian leader Vitalian, when he besieged Constantinople in the beginning of the sixth century.

Malaba, another old chronicler, however, says that Proclus operated on this occasion, not by burning glasses, but by burning sulphur showered upon the ships by machines. The possibility of the mirror burning feat was long disbelieved; but Buffon, in 1747, by means of four hundred plane mirrors actually melted lead and tin at a distance of fifty yards, and set fire to wood at a still greater, and this in March and April. With summer heat it was calculated that the same effects might have been produced at four hundred yards distance, or more than ten times that to which, in

all probability, Archimedes had to send his reflected rays. It may be concluded then, that there is nothing absolutely incredible in the account Napier gives of his first invention.

Napier's second announcement is, however, more startling: he professes to have fired gunpowder by a single mirror; but the only record of the kind we possess is of gunpowder being lighted from charcoal collected by one concave, and reflected from another.

Napier's fourth invention, the chariot, bears some resemblance to one of the famous Marquis of Worcester's contrivances.

Sailing underwater, the object of Napier's last invention, was performed in his own day, by the Dutch chemist Debrell, who is reported to have constructed a vessel for King James I., which he rowed under the water of the Thames. It carried twelve rowers besides several passengers; the air breathed by whom it is said is made again respirable by means of a certain liquor, the composition of which Boyle asserts he learned from the only person to whom it had been divulged by Debrell.

Another scheme of the inventor of Logarithms is the manuring of land with salt, as inferred from the following notice in Birrell's Diary, Oct. 23 1598: "An proclamation of the Laird of Merchiston, that he took upon hand to make the land muir profitable nor it was before, by the sawing of salt upon it." The patent, or gift of office as it is called, for this discovery was granted upon condition that the patentee should publish his method in print, which he did, under the title of The new Order of Gooding and Mauring all sorts of Field-land with common Salt. This tract is now probably lost; but the above facts establish Napier's claim to an agricultural improvement which has been revived in our day, and considered of great value, while it proves that Napier directed his speculations occasionally to the improvement of the arts of common life, as well as to that of the abstract sciences.

Reverting to the Logarithms, we may observe that among the persons who had the merit of first appreciating the value of Napier's invention was the learned Henry Briggs, reader of the Astronomy Lectures in Gresham College, who was "so surprised with admiration of them (the Logarithms) that he could have no quietness in himself until he had seen the noble person, the Lord Merchiston, whose only invention they were. When they met, almost one quarter of an hour was spent in each beholding the other, almost with admiration, before one word was spoke. At last Mr. Briggs began: 'My lord, I have undertaken this long journey purposely to see your person, and to know by what engine of wit or ingenuity you came first to think of this most excellent help into astronomy, viz., the Logarithms; but, my lord, being by you found out, I wonder nobody else found it out before, when now known it is so easy.'"

Before his invention of Logarithms, Napier devised a method of performing multiplication and division by means of small rods, having the digits inscribed upon them according to such an arrangement, that when placed along side of each in the manner directed—in order for instance to multiply any two lines of figures—the several lines of the product presented themselves, and had only to be transcribed and added up to give the proper result. These rods, or bones,

are thus alluded to by Butler in his Hudibras, where he recounts the "rummaging of Sidrophel."

"A moon dial, with Napier's bones."

A set of the bones used by Napier is preserved in his family. Sir Walter Scott, in his Fortunes of Nigel, makes Davie Ramsay swear by "the bones of the immortal Napier," the novelist having an indistinct remembrance of what these bones were.

Photographing.

The details of the photographing of the sun during the total eclipse of July 18th, on the coast of Labrador, are interesting to the general reader, and valuable to the photographer. As a matter of experience, connected with the successful working of the photographic preparations used in securing the images, their composition is given in the report. The time of exposure of the native plate was estimated to be one-fiftieth of a second; and could have been reduced to a shorter time, inasmuch as the latent image was developed instantaneously, and with great intensity. The photographic process for recording the variation of the magnetic instruments is given with much minuteness. It remains for some ingenious observer and experimenter to devise a method by which star transits and other astronomical observations shall be made to yield their own record. When this shall have been accomplished, and brought in connection with the electric telegraphic method of determining difference of longitude, all chance of error, except that inherent in instruments, will have vanished, and the very instrumental errors that may remain, when reduced to known cause and laws, will excite mechanicians to the production of still finer specimens of their skill.

OREGON ITEMS.—Michael Coyer cut a hole in the ice on the Willamette river, near Portland, and drowned himself by jumping into it. He was laboring under a fit of insanity. The ice broke up in the river at Portland, and caused considerable damage to wharves and vessels. . . . The council of Oregon city have granted permission to citizens to build a canal around the falls at that place. . . . The Willamette river is 1,178 feet wide at Portland, as measured on the ice. Martin Reasoner and Patrick Moran were drowned, Jan. 23d, on the Willamette slough, by breaking through the ice. . . . The Jacksonville Gazette says good diggings have been found in the mountains, near the south fork of the Des Chutes river which pay from twenty-five cents to one dollar fifty cents to the pan. They are on the route from Yreka to Salmon river.

News from Cariboo to the first of December had been received at Victoria. About two hundred miners were represented as intending to winter in the region of Antler creek. Nothing was being done in the way of mining. The weather experienced by those coming down from that region was represented as intensely cold.

A petition numerously signed has been sent from San Francisco to Washington, asking that the newspapers shall be sent by the ocean steamers instead of the overland mail. The delay and uncertainty of transportation by land is the main reason advanced for the change.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to the extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Steam Quartz Mills of all sizes and designs; Stamp Mills and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at McCall's mill in this city.

Knox's Amalgamator, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smut Mills; Boiler Fronts; Wind Mills; of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.
Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.

A. ROMAN & CO.

Booksellers, Importers, Publishers,

507 MONTGOMERY STREET,

SAN FRANCISCO.

We have for sale, together with an immense variety of Works in every department of Literature, the following, any one of which will be forwarded by Mail or Express as desired:

A Manual of Metallurgy, or A Practical Treatise on the Chemistry of Metals. By John Arthur Phillips, F. C. S. Illustrated.

A Treatise on Metallurgy, comprising Mining and General and Particular Metallurgical Operations, Etc. Etc. By Frederick Overman, Mining Engineer. Illustrated with 377 wood engravings.

Records of Mining and Metallurgy, or Facts and Memoranda for the Use of the Mine Agent and Smelter. By James Phillips and John Darlington. Illustrated.

Manual of Practical Assaying; Intended for the Use of Metallurgists, Captains of Mines, and Assayers in general. By John Mitchell, F. C. S. Illustrated with 360 Engravings.

A System of Mineralogy, comprising the most recent Discoveries; including full descriptions of Species, Chemical Analyses and Formulas, Etc. Etc. By James D. Dana, A. M. Illustrated with 600 Engravings.

Rudimentary Treatise on the Metallurgy of Copper. By Dr. Robert H. Lamm horn.

The Discovery and Geognosy of Gold Deposits in Australia, with comparison of the Gold Regions in California, Russia, India, Brazil, Etc.; Including a Philosophical Dissertation on the Origin of Gold in Placer Deposits, and in Quartz Veins. By Simpson Davison.

Books imported to order on short notice.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munro & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing to the Commissioner, no additional fee will be required. In cases of interference or in an appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States

CONSTINE & CO., FURNITURE FACTORY.

In our last issue we gave a synopsis of the extensive Furniture Factory of Messrs. Constine & Co.; agreeable to promise we present the different departments. The illustrations given in this issue represent the spacious rooms of the Carving Department and the Boiler and Engine Rooms.

CARVING DEPARTMENT.

New Invention.—River and Harbor Defences.

The Alta of Wednesday last, contains an excellent notice for the above invention of Mr. D. C. M. Goodsell, and for which we are now making application for Letters Patent.

"The subject of harbor and coast defences having been lately brought prominently before the public by the Secretary of War, various plans and ways are mooted for affording that additional protection so indispensable to our safety, in case of foreign invasion.

"A number of novel inventions have been submitted to our inspection, amongst which is the model of a steam ram. This is intended for service in defending the harbor, and for attack when emergency requires. The sides of the boat incline at an angle of seventy degrees, which will throw off any ball or shell which may strike them. The machinery and men are thoroughly protected below and within these walls, which of course are constructed of iron. The ram also of the same metal, projects twelve feet from the bow of the boat. It is designed that the ram shall be within 4 or 5 ft. of the surface of the water, so that, with its propelling force, this iron sword would be likely to strike an enemy's vessel in a vulnerable and dangerous locality. Owing to the peculiar construction of the craft, a hostile ball must pass through the water to the depth of four feet before taking effect. The boat, which is intended to have a screw propeller, has one wheel on each side of the stern post, and one shaft. The Ram, as the inventor calls the craft, is to be two hundred feet long, forty-five feet beam, and twelve feet hold. The total cost is estimated at \$250,000.

A steam gunboat and ram combined has also been modeled, to use at sea or in the harbor, as may be required. This is constructed also of iron, to be propelled by three wheels, and to be built for speed as well as strength. It is maintained that this craft will be able to run fifteen miles an hour. The dimensions of the boat are given as follows: Length over all two hundred feet: breadth of beam, fifty-five feet: depth of hold, twelve feet.

Still another ingenious model of a mammoth floating iron clad battery was exhibited, which, if constructed according to the architect's plan, would indeed prove a formidable engine of destruction. The idea of the inventor is to have the battery moored in the mouth of the harbor, to twenty heavy anchors in seventeen feet of water. She is to have three decks pierced for one hundred and twenty guns. This craft is intended to be four hundred and thirty-five feet long, one hundred and thirty-five feet breadth of beam, and fifty feet depth of hold. All of these models have been inspected by nautical men of experience, who deem the plans feasible, and believe that such a naval armament would go far towards rendering this harbor secure against any hostile attack from sea.

Hydraulic Pressure.

Mr. Leonard, who built, four years ago, the Sacramento and Yolo bridge, has been employed lately in thoroughly examining the same, to see if there were any weak or defective points. The examination has proved very satisfactory, both to the owners of the bridge and the builder for the timbers are as firm and sound as ever, and the structure is in excellent condition. It was found that the seventeen rollers on which the draw turns, were much worn, it being estimated that each one in its narrow sphere has traveled fifty-four miles. It was seen that new rollers must take the place of the old ones, and then arose the question as to how the draw, weighing one hundred and sixty-eight tons was to be raised sufficiently for that purpose. The hydraulic apparatus of the Messrs. Fell was employed, and the machinery having been placed in position on the timbers supporting the draw, a number of spectators were present to witness the raising. Twelve rams were used, and about half past three o'clock in the afternoon the pump was started, and in a few minutes the draw was raised to the required height. The old rollers were taken out and new ones put in their places: the wedges and rams were removed, and the draw, which had been open while this work was going on,

was turned back, and travel was resumed over the bridge at six o'clock, P.M. Although the wind blew a perfect gale at the time it did not interfere in the slightest degree with the operations, which were performed with the greatest smoothness and regularity, and this ocular demonstration of what hydraulic pressure can do, was witnessed with deep interest by several persons to whom the process was entirely new.—(Daily Bee.

Mining Prospects.

The Plumas Standard says:—From every quarter of our county comes the intelligence of cheering prospects to our miners, and business in all departments is looking up in consequence. The bars and creeks that have remained unworked for years, owing to the immense accumulation of tailings and the great expense which would necessarily be incurred in removing them, will now be forced to yield to the patient hand of toil the hidden treasures of their rocky bosoms. Since '52 a large number of the tributaries of the Feather have remained in this condition; the miners finding it impossible to work them without capital, and even when they could command this, refrained from doing so, being dubious as to whether the investment would pay. Now, however, that a mighty stream has rushed down those creeks and gulches like an avalanche, sweeping away in its mighty current those impediments to industry, which heretofore has proved an impenetrable barrier, the miners are in high glee, and think for sure that the good time we so often hear about as coming, will soon arrive. We notice a paragraph in the Sacramento papers in reference to the number of men out of employment and upon the hands of the Howard Benevolent Society. It appears strange to us that men will lie around cities, availing themselves of an odd chance for work, just sufficient to keep body and soul together; while the riches of our mines, and the thousands of acres yet unprospected; as well as the independent character of a miner's life, offer such inducements. If the Howard Society wishes to rid itself of such, we think it would be an excellent plan to ship a few thousands into this county, where industry is the only capital required, and prudent economy is a sure passport to a competence. To those men, then, we say, come! The prospects for a successful mining season were never better, nor the facilities for working the mines so good. Even those mines which have been abandoned for years, we are assured by practical miners, will now turn out rich. In fact, every indication goes to show that our county is entering upon an era of prosperity, hitherto unknown, even in its palmiest days.

THE MINER'S LOT.—Miners are mostly poor men, and others have reaped the benefit of their toils. They have denied themselves of home, society, and everything that could make life valuable. Many who have led a miner's life, say that were it not for the disgrace and restraint, they would consider State Prison life but little worse. Inured all day long in holes leading from the bottom of deep wells, buried in the recesses of mountains; in both places liable to be crushed to death or buried alive; working, working, working, for months and years, the result of all this patient toil is often times utter disappointment and ruin.—S. J. Republican.

GRAY & TRUE, UNDERTAKERS,

WOULD RESPECTFULLY INFORM THEIR FRIENDS and the public generally, that they have opened Coffin Warerooms at No. 21 Geary street, near the Market Street Railroad Depot, corner of Kearny street, where they keep constantly on hand a large assortment of Rosewood, Walnut, Mahogany and plain coffins. Everything requisite or funerals furnished on the most reasonable terms. Particular attention will be paid to putting up bodies in lead coffins, the only safe and reliable method of shipment to the Atlantic States. Also the removal of the dead from Yerba Buena Cemetery personally attended to.

fe20

W. BOHM'S BUCKLE INVENTION.

I desire to call the attention of the public to my late invention in the construction of

A NEW STYLE OF LADIES' BUCKLES,

for which I have applied for Letters Patent. It is by far the most beautiful ornament now in existence. In the Mining and Scientific Press a full description appeared. Messrs. Bravermann & Levy, 621 Washington street, have a complete assortment of all shapes and embellishments. Their cost is no more than the old style, and their simplicity and ease of adjustment considerably enhances their value. (Go and examine them!)

Bravermann & Levy,

621 Washington street, for W. Bohm.

—AND—

REAL ESTATE AGENT.

OFFICE,

In Telegraph Office, Montgomery Block.

REAL ESTATE for sale in all portions of the city. Loans negotiated on Real Estate and other securities. Deeds, mortgages and Bonds, accurately drawn up. Soldiers' Pay Claims made out and purchased on liberal terms; and claims against the United States and State Governments collected. Fhl.

SPECIAL NOTICE.

HIGHLY IMPORTANT INVENTION IN DENTISTRY.—Dr. D. STEINBERG begs leave to announce to the citizens of this city, that letters patent for his invaluable improvements in mechanical Dentistry were granted him on the 12th of November last.

This invention consists in the application of GUM ENAMEL to gold plates for artificial teeth, and are acknowledged to surpass all others in use, for their beauty of style and exactitude of fit; their weight compared with others, is less but are far more durable by the addition of the gum enamel. Specimens of this valuable invention may be seen and examined at the dental office of the undersigned, No. 648 Washington street, near Kearny. Great care and attention is devoted to the perfect filling of teeth. Teeth extracted by the humming process.

STEINBERG & SICHEL,

Practical Dentists,
648 Washington st., near Kearny.

ROYAL HOTEL.

VICTORIA, V. I.

JAMES WILCOX

PROPRIETOR.

THE ABOVE HOTEL is conducted on the most improved principles; is situated on Wharf street; of easy access to all new arrivals, being in the immediate neighborhood of all the wharves. The proprietor begs to inform the miners of California and traveling public, who intend to visit Victoria, that he has superior accommodations for single and married persons, or families, with or without board. Guests entertained at the following rates: Board per week six dollars. Board and Lodgings, \$8; Board per day, \$1; Lodgings 50 cents. The Bar is furnished with Wines, Spirits, Malt Liquors, Cigars &c., all of the best quality. N. B.—The Building is Fireproof. Ju30

NO. 24.

WIRE SUSPENSION BRIDGES, etc.

Some time since we gave some interesting details with reference to the manufactory of wire rope, by the enterprising firm, Messrs. A. S. Hallidie & Co. The above illustration represents one of those gigantic structures which has effectually bid defiance to the late ravaging flood in this State. This wire bridge extends 320 feet across Deer Creek, in Nevada county. It is needless to remark, that bridges built in this manner, will withstand the occasional visitations of inundations, or sudden rise of streams. The above firm, we learn, have a number of such bridges under way; especially one for Folsom, and another at Mormon Island. Upwards of sixty hands are employed by them to manufacture rope, and erect works of this nature. Parties desiring bridges constructed according to the above plan, have only to forward details; upon which, they will gratuitously make an approximate estimate.

Length of span, from pier to pier, as shown in the above cut. Width of roadway required, and whether intended for loaded teams, or foot travel only. Nature of the bank on sides, whether of solid rock, boulders, clay, or otherwise; And, if for a flume, give distance to be conveyed, from pier to pier, volume of water between piers, *i. e.* dimensions of flume. It is unnecessary to enlarge upon the great advantages which wire suspension bridges and flumes have over wooden structures, as this point has been fully demonstrated by the effects of the recent floods. Wire rope possesses the following advantages over all kinds of rope. It is five times the strength of the same size hemp rope.—It is only one sixth the bulk for equal strength hemp rope.—It is less than one half the diameter of a hemp rope.—It is 35 per cent less weight than a hemp rope.—It is five times as durable as a hemp rope.—It does not stretch or shrink in dry or wet weather.—It is not injuriously affected by the heat of Summer, or the cold of Winter.—It does not absorb water and double its original weight.—It is as pliable as Hemp Rope of equal strength.—It is spliced in the same manner as Hemp Rope, but more neatly.—The raw material comes from no foreign market, but from our own iron fields.—An immense saving is effected by its application.

They claim that Wire Rope, is the only kind of rope that can be used to advantage, for hoisting from deep shafts and inclined planes; for long Pump Ropes, Derrick Guy Ropes; Ferry Ropes, and Ship's Standing Rigging.

Messrs. A. S. Hallidie & Co. have an office in 412 Clay street near Battery, in this city; and their Rope Factory is situated on North Beach.

Oxide of Silver.

In 1858, Mr. Bowring describes simple and compound oxides of silver as existing in ores of Real del Monte, where they are more abundant than one of your correspondents imagines, as between the years 1849 and 1858 the mine of Rosario, in Pachuca, produces nearly 100,000 tons of ore, containing a trifle over 1,000,000 marks of silver, about half of which was from the compound oxide. During the same year, the extraction from the mines of Santa Ines, in Real del Monte, amounted to 40,000 tons, which yielded 531,715 marks of silver, nine-tenths of which were from the same oxide.

To separate the simple from the compound oxide a weak solution of salt is first added to the sample to be analysed, and the chloride of silver that is instantaneously formed by the simple oxide is washed out either by ammonia, hyposulphite of soda, or boiling solution of salt. The residuum is digested in a solution of cyanide of potassium, and filtered; on adding a slight excess of hydrochloric acid, chloride of silver is precipitated, tinged purple or rose-coloured by manganese. A double oxide of silver and antimony exists likewise in several of the mines in Mexico, and similar combinations with other metals may probably still be discovered. Precipitated sulphuret, as also native silver, when reduced to a sufficiently fine powder, are also soluble in cyanide of potassium; but, on the addition of an acid, sulphuret of silver is precipitated.

If in the Cornish gossans the silver really exists as an oxide I do not understand how the whole of the metal does not come out in the docimastic assay, as it must be reduced by heat to a metallic state, and be taken up by the lead. The only combination of silver that I can imagine that would not give its lye by fire might be a silicate, as that very probably would form a slag with the matrix. This combination could, however, be easily reduced by mixing the ore in fine powder with salt and sulphat of copper, and passing an electric current through it, in the manner described by Mr. Bowring. The reduction of chloride of silver thus formed offers no difficulty, but it must be observed that the electric current decomposes as well as forms the chloride of silver; the quantity of electricity required for this process is extremely small. If the gossans contain, as stated, merely oxide of silver, they might be very economically reduced by Mr. Zuercher's method, minus the reverberation, in the country where salt is so cheap as it is here.

The late floods damaged nearly all the mills on Kern River Yuba county, five works being swept away. The damage, including loss of dams, etc., is set at about \$20,000. The toll-bridge across the river was swept away, and in one instance twenty feet of sand deposited in an arastra mill.

ELECTRICITY.—EFFECTS OF POWERFUL TENSION.—At a recent meeting of the Academy of Sciences at Paris, Mr. Faye exhibited an experiment in which two plates of crown glass were pierced through and through by the electric spark of the great induction machine recently constructed by Ruhmkorff. One of these plates was four centimetres and the other six centimetres in thickness; (one and a half and two and a half inches nearly): On examining the path left by the spark, it was seen to consist of a white and opaque fillet extremely slender, the whole length of which presents bright places of two or three millimetres directed successively like a spiral in different azimuths. It shows no metallic deposit. In the thicker plate this track bifurcates at a depth of about one-third the thickness. Almost at the opposite face it again subdivides into many fillets, very fine and almost destitute of the bright places. During the experiment, Ruhmkorff demonstrated by the appearance of Haidinger's colored rings, that the passage of the spark was accompanied by an energetic compression of the substance of the glass. No trace of fusion was discovered in these plates at the points where it was traversed by the spark. Mr. Faye thought, nevertheless, that it would be possible to produce on a small scale true fulgurites by the aid of this powerful machine, if the spark were forced to pass through a certain thickness of some pulverulent substance a little more fusible than crown glass.

RIVER MINING IN TRINITY COUNTY.—All along the Trinity river where the water has fallen sufficient to uncover the bars, John Chinaman is busy with his "locker." The late floods having swept away much of the rubbish, and in many instances leaving entire bars bare to the bed rock, John has a good time crevicing, and we are told they are making from six to twenty dollars a day, in many localities. When the river falls to its usual mining stage, we predict that more gold will be taken out in the succeeding three months than has been during any similar length of time within the last five years. . . . The miners at Carson creek are in high glee. The diggings are yielding better than at any time for five years for the number of men employed. Over \$4,000 in dust was sent from the creek last week. Claims just opened on the east bank of the creek are paying beyond all expectations.—*Trinity Journal.*

ESMERALDA SUFFERERS.—The Silver Age says a pack train of twenty-two animals left Carson City for Aurora, loaded with flour, as the citizens of that place were entirely without that article and subsisted on beans and meat.

The construction of the Sacramento levee is being pushed on rapidly, about one hundred and twenty hands being actively engaged in building the same.

Saw-Mills.

Saw-mills are of recent introduction in this country, although they have been employed many years on the continent. Their history with that of the invention of the saw, is given at considerable length by Beckmann, in his History of Inventions, from which we quote those parts that appear most interesting.

In early periods of society, the trunks of trees were split with wedges into as many and as thin pieces as possible; and if it was necessary to have them still thinner, they were hewn by some sharp instrument on both sides to the proper size. This simple but wasteful manner of making boards has still been continued in some places to the present time. Peter the Great of Russia endeavored to put a stop to it, by forbidding hewn deals to be transported to the river Neva. The wood splitters performed their work more expeditiously than sawyers, and split timber is certainly much stronger than that which has been sawn; because the fissure follows the grain of the wood, and leaves it whole; whereas the saw, which proceeds in the line chalked out for it, divides the fibres, and by that means loosens its cohesion and strength. Split timber, indeed, turns out often crooked and warped; but in many cases to which it is applied, this is by no means prejudicial, and the fault may sometimes be amended.

The inventor of the common saw has by the Greeks been inserted in their Mythology, and placed among those whom they have honored as the greatest benefactors of the earliest ages. By some he is called Talus, and by others Perdix. Pliny ascribes the invention to Dædalus; but Hardouin, commenting on the passage in which it is mentioned, considers Talus rather than Dædalus the inventor. Diodorus, Siculus, Apollodorus, and others, name the inventor Talus. He was the son of a sister of Dædalus, and was placed by his mother under the tuition of her brother to be instructed in his art. Having, it is said, once found the jawbone of a snake, he employed it to cut through a small piece of wood, and by this means was induced to form a like instrument of iron, namely, a saw; this invention, which greatly facilitates labor, excited the envy of his master, and instigated him to put Talus to death privately. We are told, that being asked when he was burying the body, what he was depositing in the earth, he replied, "a serpent." This suspicious answer discovered the murder; and thus, adds the historian, a snake was the cause of the invention of the murder, and of its discovery.

The saws of the Grecian carpenters had the same form, and were made in the same manner as ours are at present. This is fully shown by a painting which is still preserved among the antiquities at Herculæum. Two Genii are represented at the end of a bench, which consists of a long table resting upon two four-footed stools. The piece of wood which is to be sawn through is secured by cramps. The saw with which the Genii are at work has a perfect resemblance to our frame saw; it consists of a square frame, having in the middle a blade, the teeth of which stand perpendicularly to the plane of the frame. The piece of wood to be sawn extends beyond the end of the bench, and one of the workmen appears standing and the other sitting upon the ground. The arms in which the blade is fastened have the same form given to them as at present. In the bench are seen holes in which the cramps that hold the timber are placed; they are shaped like the figure 7, and the ends of them reach below the boards that form the top of the bench.

The first introduction of saw-mills seems to have been on the Roer, a river in Germany, in the IVth century; for although Ansonius speaks of water-mills for cutting stone, and not timber, it cannot be doubted that these were invented later than mills for cutting out deals, or that both kinds were erected at the same time. Pliny conjectures that the mill for cutting stone was invented at Caria, at least he knew no building incrustated with marble of greater antiquity than the palace of King Mansolus at Halicarnassus. This edifice is celebrated by Vitruvius for the beauty of its marble; and Pliny gives an account of the different kinds of sand used in cutting it: "For it is the sand," he says, "and not the saw that produces the effect." The latter presses down the former and rubs it against the marble, and the coarser the sand is the longer will be the time required to polish the marble which has been cut by it.

Notwithstanding these facts, there is no account in any of the Greek or Roman writers of any mill for sawing wood, and as the writers of more modern times speak of saw-mills as new and uncommon, it seems either that the oldest construction of them had been lost, or that some important improvement has made them appear entirely new.

Saw-mills although employed in many parts of the continent, as early as the fifteenth and sixteenth centuries, were violently opposed in England, under an idea that the sawyers would by the use of them be deprived of the means of subsistence. For this reason it was found necessary to abandon a saw-mill erected by a Dutchman near London in 1663; and in the year 1700, when a person of the name of Houghton laid before the nation the advantage of such a mill, he expressed his apprehension that it might excite the rage of the populace. What he dreaded was actually the case; for in 1767 1768, an opulent timber merchant, by the desire and appropriation of the Society of Arts, having caused a saw-mill driven by wind to be erected at Limehouse, under the direction of James Hansfield, who had learned in Holland and Norway, the art of constructing and managing machines

of that kind, a mob assembled and pulled the mill to pieces: the damage however was made good by the county, and some of the rioters were punished.

A new mill was afterwards erected, which was suffered to work without any molestation, and which led to the erection of others. It appears, however, that this was not the only mill of the kind then in Britain; for one driven by wind had been built at Leith in Scotland some years before. From this period, particularly since the improvements of the steam engine, the number of saw-mills has increased very rapidly, and they are now to be met with in almost every large timber merchant's yard.

CONSTRUCTION OF SAWS.—Saws are constructed either of iron simply hammered and hardened, or of tempered steel, ground bright and smooth. They are known to be well hammered by the stiff bending of the blade, and to be well and evenly ground by their bending equally in a bow. The edge in which the teeth are made is always thicker than the back, because the back has to follow the edge. The teeth are cut and sharpened in a triangular file, the blade of the saw being fixed in a whetting block, and after the teeth are filed, they are turned out of the right line, that they may make the kerf or fissure the wider, to enable the back of the saw to follow more readily. This is termed setting the teeth.

In sawing valuable timber the teeth are not turned out so much (or as the workmen term it, set so rank) as for coarse cheap stuff; because the ranker the teeth the more stuff is lost in the kerf. The saws used in cutting stone have no teeth; these are generally very large, and are stretched out and held evenly in a frame.

Before saw-mills came into use the work was performed by two men with a saw, termed the pit saw, which is the one chiefly used in the employment denominated sawing. To perform the work, the timber is laid on two rollers over a rectangular pit, denominated the saw-pit: and the saw, which is of considerable length, with a cross handle at each end, is worked by the two men, one of whom stands on the timber to be cut, and the other in the pit. As they proceed with the work wedges are driven at proper distances from the saw to keep the fissure open, which gives more freedom to the motion of the saw. When they have advanced as far as the end of the pit the timber is moved forward on the rollers, which operation is repeated until the saw has arrived at the end of the timber.

SAW-MILL.—The common saw-mill, which is generally employed in cutting timbers into planks, consists of a square wooden frame, in which a number of saws are stretched; this frame rises and falls in another wooden frame, secured to the foundation of the mill, in the same manner as a window cash rises and falls, motion being given to it by a crank. The timber to be cut is placed upon a horizontal bed or carriage, sliding upon the floor of the mill, which being sufficiently narrow to pass through the inside of the vertical or moving saw frame, will carry the tree through and subject it to the action of the saw. The carriage is provided with a rack, which is engaged by the teeth of a pinion; and thus gives the means of advancing the carriage. The pinion is turned by means of a large ratchet wheel, with a click moved by levers connected with the saw frame; when the saw-frame rises the click slips over a certain number of teeth of the ratchet wheel, and when it descends to make the cut, the click turns the ratchet wheel round and advances the wood forward just as much as the saw cuts during its descent. The trees are generally dragged up an inclined plane, through a door at one end of the mill, and being placed upon the carriage, they pass through and are divided by the saw into two or more pieces, which are carried forward and passed out at a door on the opposite side of the mill.

Galvanic Soldering.

Under the name of galvanic soldering, a process is known by means of which two pieces of metal may be united by means of another metal, which is precipitated thereon through the agency of a galvanic current. This mode of soldering by the wet method has been often recommended in various periodicals relating to the industrial arts; but it has been often objected that, practically speaking, the union between two pieces of metal could not be effected by means of a metal precipitated by galvanic agency. In order, however, to arrive at a definite conclusion upon this question, M. Elsner, a Frenchman, undertook the following experiments, the results of which are in favor of the practical use of the operation of soldering by galvanic agency. Upon the end of the copper wire, which formed the negative electrode, a strong ring of sheet-copper was placed. This ring was cut asunder at one point, and the distance left between the several parts was about the sixtieth of an inch. At the end of a few days (during which time the exciting liquids were several times renewed,) the space in the severed portion of the ring was completely filled up with copper regulus, which had been precipitated; and on partially cutting with a file through the part thus filled up, and examining it with a lens, it was observed to be very equally filled with solid and coherent copper.

Another copper ring was then cut into two parts, and the two semi-angular segments thus obtained were placed with the faces of the sections opposite each other, and submitted to the action of a galvanic current. At the end of a few days, the segments were united by the copper precipitated, thus forming again a complete ring. It was also found in this case, on removing with a file a portion of the thickness

of the ring at the points of contact, that the spaces had been completely filled up by copper galvanically precipitated which had united the whole. On observing these points carefully with a lens, the regular deposition of the copper could be readily traced between the formerly separated portions of the ring.

A third experiment was made in the following manner. Two strong rings of sheet-copper were laid with their fresh cut faces one upon another, so that the two rings constituted a cylinder. These rings were surrounded by a band of sheet-tin, which was coated with a solution of wax, so that the two rings were equally surrounded by a conducting material. Thus disposed, these rings were attached to the negative wire of the battery, and immersed in the bath of sulphate of copper. At the end of a few days, the interior surface of the rings was covered with a precipitated copper and between the contact surfaces of the two rings, copper was also precipitated. These rings had only been submitted to the galvanic current to such an extent as to cover their interior surface with a thin coating of precipitated copper and yet they were already completely re-united, and formed a cylinder consisting of a single piece. The exterior conducting covering, consisting of a sheet of tin, was of course removed before testing the cohesion or persistence of the galvanic precipitate. It may be remarked, that these rings after being for a certain time in contact (during the galvanic action,) together with the plate of copper upon which they rested, became so incrustated with precipitated metallic copper, that some force was found necessary to effect their detachment from the copper wire.

There would appear to be no doubt, then, according to the results obtained in the preceding experiments, that two pieces of metal may be firmly united by means of galvanically-precipitated copper; in a word, that soldering by galvanic agency is perfectly practicable. It will, therefore, be possible to firmly unite the different parts of a large piece of metal and to make a perfect figure of them by galvanic precipitation of a metal, (copper, in ordinary cases.) If solutions of salts of gold or silver were employed in as concentrated a form as those of copper above mentioned, there is reason to believe that galvanic soldering would also result. In fact, M. de Hackewitz, states, that in some experiments on a larger scale which he undertook to obtain hollow figures by galvanic-plastic means, he had remarked that galvanic union often took place between the pieces operated upon. M. Elsner states, that while conducting the experiments above mentioned, he remarked that, by employing too powerful a current, the negative electrodes of copper, and even the plate of copper, and ring of the same metal resting thereon, became covered with a deep brown substance, in the same manner as this occurs under similar circumstances in galvanic gilding, as is well known. After several unsuccessful attempts to prevent the formation of this brown coating, M. Elsner, of Paris, found that it was possible to remove it entirely on immersing the articles covered therewith, during a few seconds, in a mixture of sulphuric and nitric acids.

By this means the precipitated copper was made to assume its natural red color. The possibility of practically effecting the operation of soldering by galvanic agency may be explained in a few words, in a theoretical point of view. The article is, in fact, in an electro-negative state of excitation, whilst the zinc operates positively; the result is, that the faces which are placed opposite each other, when the ring has been cut, are negative; that is to say, in an electric condition of the same denomination. During the progress of the electrolytic decomposition of the metallic salt in solution, (sulphate of copper in the above case,) the electro-positive molecules of copper which are detached, simultaneously arranged themselves upon the two opposite faces, and in the direction of the break. Now, from the moment that these molecules are deposited, they constitute with the piece a homogeneous mass; and from that time act negatively upon the copper which is contained in the solution, and again precipitate copper in the form of regulus. This method of operation continues until the space which existed between the two separate pieces of metal is filled up with metallic copper; in fact, the layers of copper which become deposited in an equal manner upon the contiguous faces of the metal, gradually diminish the distance which separated the latter, until at length the metallic layers which cross in the opposite direction meet each other; the result being that the whole of the break which originally existed between the faces will have disappeared, and become filled up with copper.

With respect to the solidity (the degree of cohesion,) of the galvanic soldering, it is the same as that of copper or other metal precipitated by galvanic agency. It will, moreover, be well understood, that too energetic galvanic excitation must have an injurious influence upon the cohesion of the metal precipitated; and in this case precisely the same phenomena will be observed as those which have long manifested themselves in ordinary galvanic-plastic operations.

PLASTER OF PARIS.—An excellent article of plaster of paris has been discovered at Santa Anna, Los Angeles county. By competent judges it has been pronounced superior to the imported, being much whiter and finer in texture.

COAL.—New coal fields have been discovered on the banks of the Carson river, about sixteen miles from Carson City.

Mining Companies and Associations.

Office Gould & Curry Silver Mining Company.—November 5th, 1861. Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, due at the office of the company, on or before the sixth day of December next.

JAS. C. L. WADSWORTH, Secretary.

Office of the Gold and Silver Mining Company, San Francisco, October 1, 1861.—Notice is hereby given, that at a meeting of the Board of Directors, held at the office on the 25th inst., an amount of ten cents per share levied—one half of which he made payable on or before the first day of October, 1861, to the Secretary of the company at San Francisco.

C. S. HIGGINS, Secretary.

Bullion Gold and Silver Mining Company, Van Horn District, 305 Montgomery street, San Francisco. Notice is hereby given that the regular annual meeting for the election of officers for the ensuing year will be held at the company's office on the first Monday in December next, at 2 o'clock P. M.

T. L. BIDDINS, Sec'y.

Office.—There will be a meeting of the Spies Gold and Silver Mining company, on Sunday, November 17th, 1861, at 11 o'clock A. M., at the house of H. B. Bryan, Virginia City.

A punctual attendance is requested, as business of importance will come before the meeting.

no 23

M. H. BRYAN, Sec'y.

Gold Hill Tunnel Co.—The meeting called for Saturday, November 9th, is postponed till Thursday, November 14th, 1861. The meeting will be held at the house of Webb & Coppers, Gold Hill.

A punctual attendance is requested, as business of importance will come before the meeting.

ROBERT APPLE, Sec'y.

Shareholders of the Calaveras Gold and Silver Mining Company are hereby notified that a meeting of the Trustees in Gold Hill, on the 4th inst., an assessment of twelve and one half cents per share was levied on the capital stock of said company, payable on or before the 20th inst., to the Superintendent, at his office in Gold Hill, or to W. B. AGARD, San Francisco.

Shareholders failing to pay said assessment at the time required are hereby notified that so much of their respective interests in said company as will be sufficient to pay their several delinquencies, will be sold at public auction in front of the office of Wells, Fargo and company at Gold Hill, on the 5th day of December next.

By order of the Board of Trustees,

Gold Hill, Nov. 4th, 1861.

POSTPONEMENT OF SALE.—The sale of mining ground, at Silver City, by the Adams Mining company, is postponed until four o'clock, P. M., Tuesday, November 19th, 1861. Sale to take place on the grounds of the company. Delinquents in please take notice and come to time.

By order of the Board of Trustees.

Virginia city, Nov. 9th, 1861.

Office Chollar Silver Mining Company, 612 Front street, San Francisco, Nov. 20th, 1861.—The annual meeting of the stockholders of this company will be held at their office in this city, WEDNESDAY, December 4th, 1861, at 1 o'clock A. M.

By order of the Board of Trustees.

W. E. DEAN, Sec'y Chollar S. M. Co.

GOLDEN GATE COMPANY, GOLD HILL DISTRICT.—A meeting of the shareholders of the above named company will be held at the office of H. O. Gaylord, in Virginia on Saturday, Nov. 16th, at 7 P. M.

By order.

T. A. MONKHOUSE, Sec'y.

MEMBERS of the Senator company, Congress Lodge, Devil's Gate District, are hereby notified that an assessment of twenty-five cents per foot was this day levied by the Board of Directors, payable to the Secretary at his office, in Virginia, on or before the 15th day of November, instant.

By order of the Board of Trustees.

L. W. FERRIS, Sec'y.

Office of the Gold Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Gold Silver Mining company held Oct. 25th, 1861, an assessment was levied of one-fifth of one cent on the capital stock of the company, being fifty cents per share, payable within thirty-five days to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.

By order of the Board of Trustees.

J. B. COFFIN, Sec'y.

Office Dios Padre Gold and Silver Mining Company, 215 Front street San Francisco, October 29th, 1861.—A meeting of the stockholders of the Dios Padre Gold and Silver Mining company, be held at the office of the company, on Saturday, November 16th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting. By order of the Board of Trustees.

JOS. P. NOURSE, Secretary.

Office Rogers' Silver Mining Company, San Francisco, October 15th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 15th day of November, 1861, at the office of the company, in this city.

By order of the Board of Trustees.

JOEL F. LIGHTNER, Secretary.

Office of the Sucker Gold and Silver Mining Company, Nos. 1 and 2, Montgomery Block, San Francisco, California.—Notice is hereby given that the annual meeting of the stockholders of the Sucker Gold and Silver Mining Co., will be held at the office of the company, Nos. 1 and 2 Montgomery Block, on the first Monday after the first Tuesday of January, A. D. 1862, at ten o'clock A. M., of that day, for the election of Trustees, and for the transaction of other business.

By order of the Trustees.

R. H. WALLER, Secretary.

Notice is hereby given to the members of the Arizona company, that there will be a meeting of said company held at the Recorder's office, in Virginia city, N. T., on Saturday the 23d inst., for the purpose of organizing said company. All delinquents are notified that unless their assessments are paid by said date, their interest in said company's claims will be sold to pay the same.

R. T. SMITH, President Arizona Company.

Office of the Desert Mining company, 509 Montgomery street, San Francisco, Nov. 23d, 1861.—The stockholders are hereby notified that an assessment of one dollar per share on the capital stock of the Desert Mining company, has this day been levied, payable on or before the 28th day of December next, at the office as above.

By order of the Board of Trustees.

J. H. LYON, Sec'y.

Notice.—The regular annual meeting of the stockholders of the Cedar Hill Tunnel and Mining Company, will be held at the office of the Secretary on Thursday, January 21, 1862, at 7 o'clock, P. M., for the election of officers for the ensuing year, and such other business as may come before the meeting. San Francisco, December 2d, 1861.

C. L. FARRINGTON, Sec'y.

Office of the (Russ District) Union Gold and Silver Mining company, San Francisco, Dec. 13th, 1861.—The stockholders are hereby notified that an assessment of ten cents per share on the capital stock of the Union Gold and Silver Mining company was levied on the 12th inst., payable on or before the 15th of January, 1862, at the office of the company, 410 Montgomery street.

By order of the Board.

C. J. HIGGINS, Sec'y.

Notice is hereby given that an assessment of One Dollar per foot (share) has this day been levied on the ground at the Alhambra Mining company, payable at the office of the company, 815 Sansome street, San Francisco.

By order of the Trustees.

J. O. STRAUCH, Secretary.

November 24th, 1861.

Office Ophir Silver Mining Company, San Francisco, Nov. 20th, 1861.—The Annual meeting of the Stockholders of this company will be held at their office in San Francisco, on Wednesday, December 11, 1861, at 10 o'clock, A. M., for the election of officers for the ensuing year, and transactions of such other business as may be presented.

JAS. W. WHITE, Sec'y

ADRIATIC CO.

POSTPONEMENT OF SALE.—Delinquent stockholders are hereby notified that the sale of delinquent stock advertised to be sold on November 10th, has been postponed until Thursday the 21st inst., at which time all delinquent stock will positively be sold in front of the Secretary's office, at 1 P. M.

By order of the Board of Trustees.

JOHN G. GILCHRIST, Sec'y.

Virginia city, November 10th, 1861.

A MEETING of the shareholders of the Summit company will be held at the Gold Hill Bakery, in Gold Hill, on Friday, Nov. 15th, at 7 o'clock P. M.

A punctual attendance of the shareholders is requested, as business of importance will be transacted. By order of the President.

JOHN DOYLE.

Savage Gold and Silver Mining company. A meeting of the stockholders in the above company will be held at 10 o'clock, A. M., the 17th day of December 1861, at the office of Lent, Sberwood & Co., in this city, for the transaction of important business. Parties claiming an interest in the above company will please hand in an abstract of their title either to Robert Morrow at Virginia city, to A. K. Head Nevada, or to the undersigned before the 14th day of December next.

WM. M. LENT, President.

San Francisco, November 27, 1861.

Office Crown Point Gold and Silver Mining company, 321 Front st., San Francisco, Oct. 28th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees will be held at the office of the company, on Wednesday, November 20th, at one o'clock P. M.

O. B. CRARY, President.

Office Crown Point Gold and Silver Mining Company, 321 Front street San Francisco, Nov. 6, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining company has this day been levied, payable on or before the 10th of December next, at the office, as above.

J. H. JONES, Sec'y.

Office Sierra Nevada Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 28th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City, or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees of S. N. S. M. Co.

J. H. BREWER, Secretary

Office of the Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that all stocks on which assessments are now due, and unpaid after thirty days from date, will be advertised and sold, according to the laws of California and the By-Laws of the company.

All parties holding stock of this company are requested to hand it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees.

JOSH. S. HENSHAW, Sec'y.

Office of Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty six or ninety days from date, to the Treasurer of the company.

By order of the Board of Trustees.

JOS. S. HENSHAW.

Notice.—A general meeting of stockholders, of the New Idria Mining Company will be held at the office of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.

By order of the Board of Trustees.

HENRY S. HUDSON, Sec'y.

San Francisco, Nov. 8, 1861.

Notice.—The annual meeting of the Charles Canby mining company, will be held at the office of the company (D. Davidson's room, northeast corner of California and Montgomery street, San Francisco) on Friday Dec. 27th, A. D. 1861, at 3 o'clock P. M., of that day, for the election of officers for the ensuing year, and transaction of such other business as may be presented. A punctual attendance of all stockholders is requested.

By order of the Board.

ALEX. FLY, President.

Office of Sucker Gold and Silver Mining company.—Notice is hereby given that the Board of Trustees of this company (formerly the Sucker company, Gold Hill District) have this day, Tuesday, Nov. 19, 1861, duly levied an assessment of fifty cents upon each share or foot of the capital stock of, or ownership in, said company, payable immediately to the Secretary, at their office, Nos. 1 and 2 Montgomery Block, San Francisco, or to J. A. Hobart, Trustee at Gold Hill, Nevada Territory. On default of payment of which assessment for thirty days after publication of this notice, all delinquent stock and ownership will be sold according to law, and the rules and By-laws of the company.

R. H. WALLER, Sec'y.

Notice.—Notice is hereby given, that Jos. J. DuPrat is the only authorized agent in California, U. S. of America, for the silver mines known as "Mica Rica," "Guanabana," "Fortune," "Santa Cruz," and "Nacameento," situated near San Antonio, Lower California, Mexico.

CHAS. J. DUPRAT, EM. LEVA,

DUPRAT, SCHMITZ & CO.,

CHAS. ERAFT & CO.,

La Paz, Lower California, July 30th, 1861.

For the purposes of reference, the Deeds of the above named mines have been recorded in the city and county of San Francisco, State of California. For further particulars respecting the above named mines, inquire of

JOS. J. DUPRAT,

423 Washington street.

Office of the Bullion Gold and Silver Mining Company, 410 Montgomery street, San Francisco, Jan. 13, 1862.—Notice is hereby given that at a meeting of the Board of Directors, held on the 11th inst., an assessment of ten cents per share was levied on the capital stock of this company, one half of which is called forthwith.

By order of said Board.

C. S. HIGGINS, Sec'y.

Office Cedar Hill Tunnel Mining company, No. 509 Sacramento street. An assessment of Two hundred and fifty dollars per (original) share has been levied by the Trustees, payable as follows: Twenty per cent. on the 15th of January, and twenty per cent. on the first of each month following until paid in full.

CHAS. L. FARRINGTON, Sec'y.

San Francisco January 14, 1862

Office of the Falls of Clyde Consolidation Gold and Silver Mining Company, New No. 634 Washington street, San Francisco, January 3rd, 1862.—At a meeting of the Board of Trustees of the Falls of Clyde Consolidation Gold and Silver Mining Company, held January 3rd, 1862, an assessment of one eighth of one per cent. on the capital stock of the company—being twelve and one half cents per share—was levied, payable within thirty days from this date, at the office of the company in this city.

W. L. DUNCAN, Sec'y.

Shareholders of the Osceola Gold and Silver Mining company are hereby notified that the meeting of the Trustees of said company in Virginia city, on the 2nd inst., an assessment of twenty cents a share was levied on the capital stock of said company, payable on or before the 20th instant to the Treasurer, at his office in Gold Hill, or to D. H. Russell, Virginia city.

Shareholders failing to pay the assessment at the time required, are hereby notified that so much of their interest in said company as will be sufficient to pay the amount of their delinquencies will be sold at public auction, in front of the saloon of Worthington & Russell, in Virginia city, on Saturday, the 10th day of December next, between the hours of twelve and three P. M.

J. S. WATKINS, Treasurer, Osceola G. & S. M. Co.

Virginia city, Nov. 2, 1861.

Notice to Quartz Miners.

The Union Gold and Silver Mining company having opened their mineral mines in the Rio Grande District to an extent satisfying them of the value of the same, and being contracted for the erection of a quartz mill near said mines (not exceeding five miles distant) are now desirous to contract with responsible parties for mining and delivering at an early day, at the said mill, not less than one thousand tons of quartz rock. Proposals will be received until the fourth day of February next. For further particulars enquire at the Office of the company, 410 Montgomery street, San Francisco.

C. S. HIGGINS, Sec'y.

Office North Potosi Silver Mining Company.—Notice is hereby given, that the Trustees of the North Potosi Silver Mining company, have, this sixth day of January, 1862, levied an assessment of one dollar per share upon each and every share of the capital stock of said company, payable on or before the fifteen day of February, 1862, to H. A. Eastman, at Virginia City, or the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees.

J. H. BREWER, Sec'y.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 5d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefitted by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This Journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply satisfied.

Terms.

To mail subscribers.—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 50. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Lock Box 537, P. O.

Room 24, (formerly) U. S. Court Building, Corner of Washington streets, San Francisco.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....MARCH 1, 1862.

The MINING AND SCIENTIFIC PRESS published is at 522 Merchant bet. Montgomery and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At Fifty Cents per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEROTYPING and ELECTROTYPING, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. Having the best legal talent near the Patent Office in Washington City as our associate, we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

REMOVAL OF THE "PRESS" AND PATENT AGENCY.

The business of this office having become quite extensive, it therefore made it incumbent upon us to remove from our offices in the Government House, where we had scarcely room enough to do our regular office business. We occupied said premises for nearly two years, and were really loth to leave them. Circumstance have placed us so that we now can enjoy separate offices for the printing of our MINING AND SCIENTIFIC PRESS; and the applicants for letters patent need no longer be interrupted by the thousand and one inquiries heretofore made, while we occupied said offices.

We have moved our printing rooms to Merchant street, No. 522, between Sansome and Montgomery up stairs, and the

PACIFIC PATENT AGENCY

and the Editorial rooms are now eligibly situated in the former U. S. Court Building, northeast corner of Battery and Washington streets, in room 24. All persons having business with us will favor us with a visit as early as convenient. Letters will be addressed to us in accordance with the above.

The Perils of the Desert.

Chancing a few days since to read an account of the finding of the remains of two miners, who had perished last summer while striving to cross the desert, from the sink of the Amargosa to Mono Lake, we were forcibly struck with the ominous truth of the following passage, occurring in one of Dr. Degroot's letters on that country, published in the Alta, two years ago. Never before has so fine a picture been drawn in so few words, of these fearful realms of desolation and death. There is in this description besides, a certain weird eloquence well befitting the subject, a note of prophetic warning, which those intending to visit that region will do well to heed:

"The adventurer," says the writer, "after crossing the Sierra will soon find that he has arrived in a country socially and physically very much inferior to California; without law or authority, filled with turbulent and desperate men, frequent dissensions and deadly collisions may be looked for, while sufferings and hardships, such as even the mining pioneers of California were not called upon to encounter, will have to be borne by those who go out to prospect and labor on those deserts. Fierce heat, fainting thirst, toilsome travel, and even hunger, must be the sure lot of those who go there.

In this Utah there will be arid plains to cross, steep tablelands to surmount, and marshy lagoons to wade through, without a green tree to shade the weary traveler, or a drop of water to quench his burning thirst; toiling over the yielding earth or flinty rocks, feeble with hunger and half famished from drough, the strong limb will grow weak, and the stout heart faint, till the hardy miner in the strength of his

manhood will yearn like a child for the cool stream that danced by his cabin amidst the woody hills of California. Here he will perceive, when perhaps it is too late, that he has come a long way to reach a lonely, barren and inhospitable region, of savage aspect and dubious wealth—a land of bitter waters and blistering sands—a basin filled with mephitic pools and ponds of ley, thickly strewn with lava, basalt, slag and cinders, the apparent vestiges of a pre-existent system, a primitive wilderness, so scorified, saline and sulphurous, that it would seem to have been rained upon by fire and brimstone, and afterwards sown with salt. Here without shelter or guide the miner will be exposed to unwonted deprivations and dangers, and it is much to be feared that many a stout and intrepid man, overcome by fatigue and thirst, will yet perish miserably on those solitary deserts, with no shroud but his grey blanket, and no sepulchre but the drifting sands.

Formation of a New Coal Company.

We learn that another company is about being formed in this city, for the purpose of working the new found coal mines in Nevada Territory. One is already organized and at work under the name of the Pioneer company, their operations being carried on upon the Whitman claim, where the coal was first discovered, and from which several hundred tons have now been raised. The grounds of the new company are to be called the Carbondale; consists of the following six claims, being a portion of those exhibited in our diagram of last week, viz., D. L. Mulford, F. Tagliabue, H. Degroot, R. Hardy, N. S. Bowen and W. Beachamp. Each of these claims consists of a quarter section of land, being one hundred and sixty acres, or nine hundred and sixty acres in the whole.

This tract, as will be seen by our map illustrating the coal fields, adjoins Whitman's on the northwest, and as the surface indications upon it are precisely like those on the Whitman ground, there is every reason for thinking it of equal value with the latter. We believe it is the intention of the Carbondale company to have an acre of their grounds represent one share of the stock, a very convenient and judicious arrangement. It is their purpose to commence opening their mines at once, and being out of debt, and composed of experienced and energetic men, we presume operations will be pushed with vigor and success. We do not know that any of these grounds are for sale, but hear of offers being made for it that indicate great confidence in its value on the part of capitalists.

Electric Telegraphy.

The telegraphic cables which unite England and France are quite insufficient for the wants of the two countries, and now more than ever it is important to increase the number of these lines of communication. Soon the two nations will be united to each other by thirteen wires, namely, four from Calais to Dover, four from Boulogne to Falmstone, four from Dieppe to New Haven, in Sussex, designed to communicate severally between London, Marseilles, Lyons and Bordeaux. Lastly, there exists a communication between the two countries by the Jersey and the Guernsey islands. This line, which is composed of only one wire, starts from the vicinity of Goutances.

Transatlantic communications are more than ever the order of the day. While the Russians are actively engaged with the long line which ought hereafter to unite the ports of the South of China to those of America, remarkable efforts are being made in France as well as in England to unite Europe and America. The project which finds most favor in England is that of Col. Schaffner, who proposes to correspond with America by the north of that continent and the north of Europe. The cable will start from the coast of Scotland and proceed by way of the Faroe islands, Iceland, Greenland, Labrador, Newfoundland, and Canada to New York.

In France there is little sympathy for this northern line. The low temperature may become an obstacle in those desolate regions, frequently agitated by snow storms and traversed by auroras which are well known to cause disturbance of the telegraph; this inconvenience is not compensated by the sub-marine lines in waters covered with ice and disturbed by volcanoes as the neighborhood of Iceland. This project therefore offers less prospect of success than that which has been but imperfectly executed between Valentia and Newfoundland.

The French project proposes a line to start from the shores of Brest and touching at the island of Flores, one of the Azores, to terminate at St. Pierre Miquelon near Newfoundland. The distance across is without doubt greater, but the cable would be placed in more favorable conditions.

We may mention that the cable from Malta to Alexan-

dria has been laid without obstruction; there are intermediate stations at Tripoli and Cengari. The completion of this line will enable us to hold communication with India in thirteen days.

At the same time a new cable has been laid between France and Algeria; this new cable starts from Port-Vendres; the first section is already laid, reaching to Mahou.

Electro-Magnetism.

Mr. Leroux, Assistant Professor at the Polytechnic school has recently made some very curious experiments upon the current of the pile by the use of very fine connecting wires. For the purpose of producing incandescence, Leroux prefers a wire of platinum. A wire one-fiftieth of a millimetre in diameter was thus maintained at a red heat through a length of fifteen or twenty centimetres, and there was required for this purpose only a dozen elements of Bunsen's battery. When it is desired to avoid incandescence, and to have a very long conducting wire, it is better to employ silver, which offering less resistance causes diminution of the current. With a silver wire of one-fiftieth of a millimetre in diameter, ten elements of Bunsen's battery are sufficient to produce through a length of forty or fifty centimetres the interesting results we are about to consider.

Presenting such a platinum wire, rendered incandescent, to the poles of a powerful magnet or an electro-magnet, the wire if rendered sufficiently flexible assumes a series of configurations depending on the direction of the current, and whether the line joining the extremities has an axial or an equatorial position. Such a conducting wire is attracted by a mass of iron; this is the counterpart of the original experiment of Arago that a conjunctive wire attracted iron filings where it was traversed by a current. The experiment of Leroux generally succeeded best when the mass of iron presented a large surface; the conductor was then attracted to it and remained adherent.

Lastly, Leroux showed how a fine conjunctive could be made to coil itself spontaneously around the pole of a magnet when it was placed in a suitable position.

Upon one of the poles of a horse-shoe magnet, he fixed a armature of soft iron, eight or ten centimetres in length, turned and polished. To this armature he attached the extremity of a silver wire, holding the other extremity in his hand, but so loosely that the wires could constantly obey the forces which solicited it. This wire when traversed by a current coiled itself around the armature and there formed a helix wound in a direction opposite to that which would be required to give the armature the same magnetism which it already possessed. For the more convenient performance of this experiment, and to render it so to speak, more general, a metallic bobbin upon which the wire is wound may be suspended above the magnet. In this way the experiment may proceed without the aid of the operator; the more constant the length of the wire passed over by the current the less danger is there of burning it as sometimes happens. We observe thus a new kind of motion obtained by the action of the pile. To regulate this motion and to prevent its undue acceleration, there may be placed upon the axis of the bobbin a much smaller cylinder, upon which a silk thread stretched by a suitable weight, winds up in an opposite direction.

Mining Suit.

A suit has been commenced in the Twelfth District Court of San Francisco by the Rogers Silver Mining Company against the Flowery Mill Company, of Storey county, N. T. In their complaint the plaintiffs allege that last spring they made a contract with the defendants, by which the latter were to erect a mill for the purpose of crushing and reducing gold and silver ores in the Flowery district, near the Rogers Company's mine, and to crush 2,000 tons of rock or ore, and extract the gold and silver therefrom, and were to receive as compensation therefor, first all the proceeds of the ores when not exceeding \$20 per ton; second, on all ores yielding over \$20 and less than \$40 per ton, \$20 per ton, and one half of the yield over that amount; third on all ores yielding \$40 and not over \$60, to receive \$30 per ton; fourth on all ores paying over \$60 per ton to receive \$30 per ton and 25 per cent. of excess over \$30 per ton. The plaintiffs allege that as a part of the contract on their part they were to deliver to the mill 15 tons per day, and that in order to fulfill their part of the terms of the contract they have had extra help at a great expense, and have complied with their agreements in every respect; but the defendants have refused to fulfill the contract, and by their refusal the stock of the company has been damaged in the market to the amount of at least \$10 per share, or in all \$28,000. And further, that the Mill Company has worked about 50 tons of the ore which plaintiffs delivered to them, for which they have never accounted, and for all which grievances the plaintiffs claim damages in the sum of \$67,000.

ANOTHER FATAL ACCIDENT.—We regret to learn that William Wagener, a carpenter, an old and well known resident of Camptonville, in Yreka county, met with a fatal accident, by falling from a flume which he was engaged in repairing, a distance of fifteen feet, and breaking his neck. Oliver Wolcott, who was assisting him in repairing the flume, endeavored to catch him, as he fell, and was drawn over with him, cutting his face in a severe manner.

From our Esmeralda Correspondent.

AURORA, Feb. 16th, 1892.

ED. MINING AND SCIENTIFIC PRESS.—Some of these highly enterprising individuals, designated "our own correspondent," have lately issued a judiciously selected moment, what they are pleased to call Letters from Esmeralda. I see nothing extraordinary in these letters, except it be the impudent affront of stealing the public for great "excitation capitals," a page of moonshine and a column of advertisements. There is a difference between being smart and conscientious. The treasure seekers on this side the mountains are upon the eve of creating a great sensation upon the world men, the world over. We are bound to astonish the natives far and near, and prove even to the satisfaction of our Washoe neighbors that abused and despised Esmeralda will yet outshine any jewel in the metallic firmament. (The Evening Bulletin, January 2nd, 1892), "Those at work crush from five to ten tons of rock per day each, yielding an aggregate product of \$4000 daily;" when the express import to your city is about \$1400 monthly! It is now so rare a thing with us to find truth in anything that is reported regarding silver land, that even a few months ago the same Bulletin had to resort to a precautionary reserve in noting and giving place to a communication from a gentleman who is personally interested in the Ophir, because he and others similarly circumstanced, always feel and write of them in a more hopeful fashion than uninterested outsiders.

This communication as well as his correspondent's letter of Esmeralda, was a mere tissue of misstatements from beginning to end. But Mr. Collier, as silver mining enterprises have lost nearly all their romance and by severe experience have taught our adventurous population that fortunes cannot be realized in a day, even on the Comstock or Esmeralda lead, how true then the proverb that "it takes a mine to work a mine," and to learn that hard earned experience and persistent industry are the only roads to wealth. It is not my purpose to underrate the silver mines, for there is no doubt that they will ultimately prove of immense benefit to this State and the world; but to our subject:

CLIMATE.—We have already had two snow storms of considerable severity in the middle part of last month, and may reasonably look for others from time to time during this and the next two months to come, although at the time I write you the weather is more mild; but we do not flatter ourselves that we have yet got through the winter, therefore it would not be advisable for parties intending to visit this region to be in a hurry about setting out.

Very little in the way of prospecting can yet be done, while tools are scarce and provisions dear, as they must continue to be until the roads over the mountains are improved, and further improvements are made on those leading in from Carson Valley to this place.

Last fall M. Laure, French engineer 'envoyé du gouvernement,' diplomatically speaking, took the altitude of camp Esmeralda, which lies some four hundred feet higher than Aurora, and computed it to be about the same as Virginia City. From personal observation as one of the pioneers of the winter '90 and '91 in Washoe, I must confess that the climate here is far milder; only in two or three towns has the thermometer marked twelve below zero, which in the former place was of daily occurrence. Virginia may account for a colder climate, perhaps owing to its greater proximity to the main chain of the Sierra Nevada, it being but ten miles in a direct line, while Aurora is twenty-five miles from the base of those mountains. To what extent this difference is dependent on proximity to the Sierra, is seen in the fact that there is always one-third more snow on the west than there is on the east side of Carson Valley, though it be but eight or ten miles across. Aurora, in its architecture, as well as the variety of material employed in its construction, is perhaps the most unique and diversified town in existence. Some residences and business places are built of stone, brick, and some of lumber, the remainder as a general thing, are composed of no other material, earth, stone, logs, canvases and shakes, and in some instances all at the same time. Although by a variety of expedients, the people having managed to protect themselves against the rigors of the climate, not a few have escaped the inclemency of our late storms of rain, many roofs were torn in pieces, chimneys overturned, adobies melted. Fortunately Aurora by next spring will not be left to depend upon mother earth and lumber alone for shelter: a quarry of rather soft granite, easily dressed by a hatchet, and hardened by exposure to the air, forms a most convenient and desirable building material; besides in the vicinity of the town an abundance of sandstone, slate, marble, and other various kinds of cement are found for making bricks.

FRUIT.—An abundance and even near at hand, "Pinon" for the Spaniards, "nut pine" for the Utah Utes, and shrubby pitch pine for your humble servant and company. This tree yields the nuts of which the Indians are so fond of, and upon which they are sustained during winter; though worth little for purposes of lumber, it answers well for timbering the mines, while as an article of fuel it is unsurpassed, lasting almost as long as hard wood, and emitting a good degree of heat; it has a close fibre and burns freely, even when green, owing to the amount of resinous substances which it contains. In this section it grows larger than about Virginia city, some trees reaching a height of forty or fifty feet, and being over a foot through. It usually attains only about half this size, but as the tree throws out a great many branches, it affords a good deal of fuel, even though the trunk be small. The region from which most of the lumber is drawn lies along the base of the Sierra, a little southwest of the Big Meadows on the East Walker. There is a considerable scope covered with pine forests, through which flow numerous streams, always kept full by the snows, constant on the adjacent mountains. This timber is of fine quality, being plentiful and close at hand. Lumber can be made at a very moderate cost, selling for the present from sixty-five dollars to one hundred dollars per one thousand feet, according class, credit and material.

The mines are thus favorably situated in regard to lasting supplies of fuel and lumber, a condition that must insure to the great advantage of those who shall hereafter invest or work the same.

MILLS.

Considering the difficulty of new settlements and the "Harpies tongues" of our neighbors, Capitalists have nobly responded for the wants of the mines; there are nine mills now erected, of which three have been in constant working, only for free mill. Clayton's mill, for want of machinery, will resume working in the Spring. This mill was intended to work the ores for both metals. Dow's, erected on the same principle, will also stop working for the next two months, hoping to receive in the meantime his amalgamating pans. Brodie & Story's mill, one of the most substantial here, erected for the purpose of reducing silver ores under the direction of our State Assayer, Dr. Lawrence, who is one of the interested parties, has been com-

pelled for the present, to delay momentarily their operations; the late storm having destroyed their saws, which it is to be hoped will be replaced in a few days, as our expectations are on the issue of this mill; which, under the direction of the most able engineer of California, Mr. James Brodie, and our well known Chemist and Metallurgist, Dr. Lawrence, cannot fail to give us the full value of our mines. The Napa Mill, and also Dr. Gibbons', expect to be able to run in a few days.

Thus you see by this account, that "our own correspondent" of Aurora, (Bulletin, January 2nd,) has rather pictured our Mill men too vivid, and that the aggregate product of \$4000 daily, is rather "a little" too heavy in these snowy and stormy days! Still, I don't doubt that, that amount will be reached perhaps earlier than Spring, if our freight expectations comes up to the point, and every mill can resume their work.

Mines.—Here as well as in Washoe, the pocket specimens have prospected astonishingly well, being surprisingly rich in gold and silver. A year has now elapsed since the discovery of the mines here, and yet so far as the public is informed, no considerable quantity of the ores has been reduced, nor has any great number of ledges been opened to a sufficient depth to determine their character as workable mines. It is true there were here neither facilities for getting out the rocks, nor mills for bulking the same; but for the present it would seem that we should by this time have a few more facts bearing on these points as guides for action and data for some sort of opinion. Speculators and their agents, both here and elsewhere taking advantage of this uncertainty, seem to have combined to depress the value of claims with a view of buying them up at mere nominal prices. While it must be admitted that we know but little more about these mines than we did last fall, it is but fair to state, that so far as prospected, they have generally turned out well, the metallic veins increasing in size as well as richness, the deeper they have been penetrated; this is particularly the case with silver ores, which have uniformly improved in proportion to the depth the ledges have been opened.

A number of claims at one time supposed to be highly auriferous, quantities of rich quartz as well as free gold having been found near the surface, have since proved of little value, being mere spurs or pockets, as, to any one at all conversant with the geology of quartz ledges, might have been apparent from the first. In their eagerness to secure as much ground as possible a certain class of miners took up almost anything that looked like a ledge, so that it contained a fair show of the precious metals good for San Francisco market; this practice had encouragement in the fact, that no more than \$10 worth of work was required by the by-laws of the district to be done upon each claim until the 1st of June, at least such was the construction upon the law, the intention of the framers being that this amount of work should be expended on each claim after being recorded. In my next I will mention such ledges as seem entitled to special notice. I must now close for want of space.

Coal Beds in California.

The Marysville Express has the following article respecting the coal fields in their valley.

We believe, says that journal that coal, of an excellent quality has been discovered in different sections of the State, and of how we have heard much in regard to the discovery of the same in our own valley. It is quite evident to the people of this city that our present resources for fuel will soon be exhausted, and the necessity for providing for such an emergency is very essential for the future prosperity of the State. The coal fields in this vicinity are rather limited, and the heavy loads that have been made upon the same have diminished the supply in such a manner as to cause anxious inquiries in regard to the future. This country is very productive in almost every kind of mineral wealth. During years past attention has been absorbed in the golden veins of the mountains, and the rich deposits to be found in the streams winding the course through our valleys. So absorbed were our people in accumulating the material that they have not been thought of sufficient importance to delve the earth in search of other treasures that might present themselves. But now it is plainly to be seen that some relief should be afforded our woodlands; and the prices demanded for our daily fuel are well calculated to awaken a proper interest among our citizens. We have been told by scientific men, that immense deposits of coal exists in this valley. If this is the case, why has not a proper attention been directed to this important source of revenue? Coal abounds in different sections of the Atlantic States, where the country certainly does not indicate its presence in such a degree as does that of our own. If it should be produced here it would materially aid in the development of many of our manufacturing and mining interests, in a manner well calculated to aid in the prosperity of the future welfare of our young State. Amid the political wrangling and party strife incident to the assembling of our State Legislatures, the important matter of the development of our mineral resources of our State have been lost sight of, and we have undoubtedly been daily passing over vast deposits of wealth, which should long ere this have been brought to light, if a proper attention had been brought to bear for a promotion of our mining interests. These are the interests which have carried us through and built up California. Instead of taxing and crowding down mining, as has been suggested in some quarters, we go in for holding out every inducement for the investment of capital in this enterprise, and throwing around the same such a protection as will encourage miners to pursue the coal fields in an extensive manner. We should be pleased to hear from any of our friends in regard to this subject, and shall take pleasure in laying their suggestions before our readers. That coal exists among us, we think there is not a shadow of doubt. That it will prove a profitable investment for working the mines when discovered is evident to all; and that it will receive a proper attention, is our most earnest desire. We trust this matter will attract at least a little attention from our citizens, who will receive a rich reward for their trouble in the future.

Mining Intelligence.

The following item clipped from the Mariposa Gazette substantiates the opinions set forth by the Press, as regards the effects of the floods upon river mining:

The late floods, says the Gazette, have brought into the creeks and rivers fresh deposits of gold, and the beds of streams will yield as well next summer, because of this high water, but not to the extent anticipated. The deposits in these streams have been slowly accumulating for thousands and thousands of years. The slowly decaying quartz veins yields a portion—slides and washing of the hill sides another portion; but very slow is the concentration of as heavy a metal as gold, scattering over the whole country in greater or less quantities. Mariposa creek will probably pay better the coming season than last, because immense amounts of old tailings, many of which have not been disturbed since '52 have been washed down and away, distributing the gold contained in them in the channel of the stream.

The Suoma County Democrat proposes to drain the Sacramento Valley and at the same time secure it from future inundation by means of a canal from Knight's Landing to Susan Bay. Knight's Landing has been ascertained by survey to be sixty-two feet above that bay, consequently the construction of the canal would not be costly. It would deprive the Sacramento river and its tributaries of their surplus waters, not only keeping the valley of that name from being flooded, but drain the valuable tule land of Yolo county and along the river from Knight's Landing to Bonin.

[The proposition is a novel one and worthy of consideration. Who can advance a better idea?—ED. PRESS.]

The Salmon River Mines.

Here is a specimen of news, which we clip from the Trinity Journal, that is in keeping with the general run of such things at such times of excitement as these. Read, and then take a realizing sense of the true meaning of the composition before embarking:

DEAN FAILURE, SALMON RIVER, }
Dec. 24th, 1891.

DEAR G.—I arrived here on the 10th of September; prospecting round for some time; finally got a claim to suit me; have worked in all twenty days, and made sixty-five thousand dollars. I run a poor hand to write, and besides am very busy. Bill Blow will finish this letter. Hoping that you have got a good thing in old Trinity, and sense enough to stick to it, I remain

Yours truly,

D.—F.—.

FAIRBANKS G.—I find the above letter lying on our camp table, with a request to add something; accordingly I write a few lines. Half has not been told of these mines. The results of labor here are almost fabulous. Everything is going on after the 49 style in California. To give you an idea: They are playing a little game of "draw" in the next cabin, where the "man" is a yeast powder can full of dust, and an oyster can full is a common thing.

The snow is from ten to fifteen feet deep, but it doesn't interfere with mining—they "cayote" under it. Come up. If you haven't got funds we will send you a draft on Adams & Co. I haven't time to write more.

Your friend, Wm. B.—.

P. S.—D.—F.— has just come in to dinner, and has in his pan seventeen thousand dollars.

In haste,

W. B.

Sierra county.

The floods sweep away the fortunes and drowned the hopes of thousands of our people; but while playing its destructive pranks it also carried off the tailings of our rivers, which will enable the miners to reach the pay at the bottom of them, without expending a summer's work in shoveling and raking them up by derelict, in order to get clear of them. It frequently happened that companies, worked at putting in the flumes, and getting clear of tailings, until the season for mining was expended, and the rains set in and drove them out, leaving good pay in the bottom. There has been removed from all the gold bearing streams of Sierra county, an average of ten feet of tailings. Now for the last six years these tailings had to be cleared off, and they contained so small an amount of gold that they were not considered worth working, yet they all had gold scattered through them. The freshet has sluiced this gravel, and left the gold in the bottom of the river. The miner has at once gotten rid of the tailings, and the gold is saved, and now when he commences work the river will pay from the top down.

If we mistake not there will be more gold taken from the river and creek beds this season, in our county and in the State, than in any season for the last six years. While the harvest in the valley may be short, we predict the proceeds from the river will be greater than usual. God grant that it may be so, and that labor be rewarded with a plentiful return, all over our deluged State.—[Sierra Citizen.]

Esmeralda.

The Silver Age of a late date gives the following news:

We have late news from Esmeralda, by Hunt and Foster, who arrived here yesterday with three teams; they returned to-day bailed with flour. These gentlemen report the roads in very tolerable condition and being rapidly improved. The following mills are in full operation, running day and night: Dr. Gibbons', Taylor & Co's, Brodie & Story's, Dow & Brodie's, Union, Napa & Green's. The last mentioned mill has recently started; it is using the Clayton process for sifting silver. Their first crushing was boulders from the Del Monte claim, from which they cleaned up eighty-five dollars in specie and fifteen dollars in gold, to the ton. Clayton's new twelve-stamp quartz mill has just got to work. It is also fitted for the reduction of silver ores, using the same process as the Green mill. The last run of Taylor & Co's mill was on Elma rock, principally valuable for silver; the tailings were saved for future working. A new lode of gold bearing quartz has lately been discovered, and named the Mountain Flower; it is richer than anything heretofore found in the district. The weather is fine and business improving. The citizens of Aurora are delighted with their prospects, and are perfectly satisfied that the riches of the country shall be judged by their exportation of bullion.

Nevada Territory.

The Silver Age gives the following particulars regarding the Sigel District:

We were shown the other day several specimens of gold and silver bearing quartz from the above named district, situated about thirty miles northwest of Virginia city, which looks full as good as the best in the Territory. Some specimens show free gold as plainly as Luce's Nightingale's Humboldt specimens which many of our citizens saw a few days since. Two years ago the writer of this with several others explored what is now the Sigel District. A great number of quartz veins were found and claimed, but before any of them were developed the Indian war broke out and the miners were compelled to leave. Before or none returned that year, but last summer a company of Germans hit upon what they now call the Wolverine lode, and formed the Sigel District. Another is called the Sholes lode, the rock from which also appears very favorable.

New Mexico.

The mines at Santa Fe are said to be really valuable. They are situated at the foot of the main snowy range of Eastern New Mexico, which rises to a great height above them. The leads of auriferous quartz are abundant and rich. Placer diggings exist in patches here and there. They contain considerable coarse gold, and would be productive were it not for the scarcity of water. There is one quartz mill crushing rock from these ledges, and doing well. It obtains water from a well twelve feet deep. The gold produced is worth nine dollars and forty cents per ounce. The climate of Santa Fe is described as mild and pleasant.

CALIFORNIA MARBLE.—A call at the marble yard of Paltenghi & Larsen, on Jackson street, yesterday, afforded us satisfactory evidence that the resources of California in regard to the raw material of their business are in all respects adequate to the home demand and for exportation. They use all grades of foreign and domestic marble—the latter of which is quarried at Indian Diggings, El Dorado county. The quarries were discovered several years since by Aitken and Luce of Sacramento, and the product is gradually working itself into popular favor. There is but little of it being worked here at present, it being impossible to obtain a supply, in consequence of the suspension of transportation from the quarries. The marble is very delicately marked with bluish veins, is of very fine grain, susceptible of an exceedingly beautiful polish, and is deemed equally as enduring as any imported, and suitable for every style of manufacture except in the statutory line. It has been the more extensively used heretofore for monuments, tombstones and table tops, and fine specimens adorn Lone Mountain Cemetery and the Cemeteries of Sacramento. The beautiful monument erected to the late Assemblyman Bell, in the State plot at Sacramento, is made of this description and pronounced equal to any in the State. While marble was discovered several years since near Columbia, Tuolumne county, by Devine & Brother of Sacramento, who completed last year extensive facilities for quarrying. The first product of these quarries—scarcely removed from the outcroppings—was fair in quality, but the marble increases in fineness with the depth to which it is quarried, and it is anticipated will be fully equal to any statutory marble in the world. The development of the quarries in question will save to the State a large amount, which annually sent abroad for the imported article, and we hope so less on the expense that the home product will be more freely used among us for the many purposes to which the several varieties are adapted.

PALTENGHI & LARSENEUR.

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends they wish disinterred, are informed that I have the most complete registry in existence of graves in that cemetery, having added to my own records by purchase, the books of the late city section. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miners Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter, of 30 pages, is devoted to assaying. These chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as unfortunately, only a small portion of the miners do possess.—[Alta California.

A BOOK FOR THE MINERS.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work is the "Miner's Companion and Guide, and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's treasured its hidden treasures.—[Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold
is below 300-1000ths. fine. 3cts per oz.
" from 300-1000ths. to 750-1000ths fine. 7cts " "
" " 750-1000ths to 950-1000ths " 14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce ½ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths. cents. per standard ounce, ½ per ct. gross value of silver for making bars; also when gold is contained ½ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. ½ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. ½ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. ½ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of ½ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Shoes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Fruit Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GOIPARD & CO.

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY
Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Opbir Mining Company, } San Francisco
Union Reduction Company, }
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for simplicity, durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up without removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing. **KNAPP, BURRELL & CO.,**

California Inventions.

SPADING MACHINE.—A machine which the proprietor thinks calculated to take the place of the plow in many instances, has lately been introduced into California. It consists of a series of steel teeth, set in endless chains revolving around cylinders, so as to effect the ground very much the same as forking. One of these is now in this city, the operation of which will be shown at the farm of Hon. N. Coombs on Wednesday next, 26th inst., at 2 p. m. This machine has been tried in various localities in the Eastern States and at Oakland in this State, and has met with very general favor. All interested in the improvement of agricultural tools, are invited to witness the operation of this instrument.

IMPROVED HOOK FOR A WHIFFLE-TREE.—among recent inventions is an improved hook for a whiffle-tree, from which the trace can never get loose, however slack it may be while in use. It is also as handy to hitch and unhitch as one of the ordinary kind. This hook is attached to the whiffle-tree by an iron strap, and plays loosely up and down, turns quite round behind the whiffle-tree, where alone the trace can be hitched and unhitched. As soon as it slips from that position the hook fits close to the iron at every other point, whether pulled tight or left slack. Naturally when the trace is slack, the hook falls and hangs by its own gravity below the whiffle-tree; but it is almost if not quite impossible that it should turn round on the rear side so as to unhook.—*Tel.*

VALUABLE INVENTION.—M. Glatard has invented a harness which can be detached from the horse by merely pulling a rein specially devoted to that purpose. A brake at the same time stops the carriage. This permits the driver, in case his horse becomes unmanageable, to let him go entirely freed from the harness, so that he will not be likely to injure himself.

NEW INVENTION.—We learn that Wm. S. Brown, of Lexington, Santa Clara County, has invented a machine for the manufacture of all shapes and sizes of shot from cold lead. If this machine accomplishes all that is claimed for it, it will be of inestimable value.

CANNON INVENTION.—James Rosse of San Francisco, has invented a cavalry cannon, to be carried on horseback and fired therefrom.

SERIOUS ACCIDENT IN VIRGINIA CITY.—On the 14th of Feb., at the Spanish mill, one Charles Rosenblade was engaged in hoisting quicksilver from one floor to another by means of a pulley, passing one end of the rope around the shaft that turns the barrels, for the purpose of assisting him in raising the weight. His leg by some means became entangled in the rope, and was drawn under the shaft breaking it just below the knee. A consultation of physicians was held, and they decided that amputation was necessary, which was accordingly performed.

BIG THING.—The Silver Age says that Wm. Stewart has lately sold twenty-two and a half feet of Gold Hill ground for \$81,000.

ED. THE MINING AND SCIENTIFIC PRESS is a very useful journal to all intelligence seeking Californians, published by J. Silver Smith, San Francisco. Send us a copy of your "Miners' Companion and Guide."

We acknowledge the highly complimentary remark from our excellent mountain cotemporary, the Mountain Messenger, of La Porte, Sierra county, California. While we were at the State Fair last August, in Sacramento, we made the acquaintance of the associate editor, Mr. Byrne, to whom we presented a copy of the "Miners' Companion and Guide," but no notice appeared in the Messenger thereof. We shall be pleased to forward another copy of the "Guide" to the "Messenger."—[Ed. Press.]

HENDRICKSON'S CARRIAGE MANUFACTORY.

We present our numerous readers this week with a beautiful illustration of Hendrickson's Carriage Manufactory, which is elegantly situated on Market st., Nos. 628 and 630, a short distance above Montgomery. This manufactory is too well known in this city to need any comments from us; but to our friends throughout the country we would state, that if they would be well served they cannot do better than send their orders to this enterprising and long established house.

THE GOLD FEVER RAGING.—Within forty-eight hours, says the San Francisco Call, nearly a thousand eager adventurers have left our city for the New El Dorado, with what success let the history of Frazer river and kindred excitements tell. The Brother Johnathan on Monday, took out six or seven hundred, and the Snuffy South had a full load yesterday. Other vessels are already advertised, and the history of another gold bubble is soon to be written with all its details of disappointment, suffering, and in many instances despair and death. Extra vessels are about to be put on the route to accommodate the increased travel.—[En. Press.]

A piece of quartz was picked up in the rear of Mariposa, a few days since, which upon being ground up, yielded two hundred dollars.

A. S. HALLIDIE.

H. T. GRAVES.

A. S. HALLIDIE & CO.,
WIRE SUSPENSION BRIDGE BUILDERS,
and Manufacturers of
PATENT WIRE ROPE.

WIRE Suspension Bridges of any span and capacity erected, and material furnished.

Having been constantly engaged in the erection of Wire Suspension Bridges and Aqueducts for some years past, we are fully prepared to do such work satisfactorily at a low figure, and to guarantee PERMANENCY.

Parties who are about erecting bridges will find it greatly to their advantage to give us a call before deciding to build wooden structures, as the recent floods throughout the State have proven them to be wholly unsafe and unreliable. A number of our wire suspensions are now in use in different localities throughout the State, no one of which has been in the least affected by the freshets.

WIRE ROPE, for mining and ferry purposes, manufactured of any length and size required, being cheaper and better than hemp.

Scales of weights and strength with prices, furnished on application to the manufacturers. Send for a circular.

M1.

A. S. HALLIDIE & CO.,
412, Clay street, San Francisco.

GRAY & TRUE, UNDERTAKERS,

WOULD RESPECTFULLY INFORM THEIR FRIENDS and the public generally, that they have opened Coffin Warerooms at No. 21 Geary street, near the Market street Railroad Depot, corner of Kearny street, where they keep constantly on hand a large assortment of Rosewood, Walnut, Mahogany and plain coffins. Everything requisite or funerals furnished on the most reasonable terms.

Particular attention will be paid to putting up bodies in lead coffins, the only safe and reliable method of shipment to the Atlantic States.

Also the removal of the dead from Yerba Buena Cemetery personally attended to.

W. D. GRAY.
T. TRUE.

W. BOHM'S BUCKLE INVENTION.

I desire to call the attention of the public to my late invention in the construction of

A NEW STYLE OF LADIES' BUCKLES,

for which I have applied for Letters Patent. It is by far the most beautiful ornament now in existence. In the MINING AND SCIENTIFIC PRESS a full description appeared. Messrs. Bravermann & Levy, 621 Washington street, have a complete assortment of all shapes and embellishments. Their cost is no more than the old style, and their simplicity and ease of adjustment considerably enhances their value. (Go and examine them!)

Bravermann & Levy,
621 Washington street, for W. Bohm.

WILLIAM L. DUNCAN, NOTARY PUBLIC,

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. V.

SAN FRANCISCO, SATURDAY, MARCH 8, 1862.

NO. 1.

The annexed illustration represents an excellent improved drill, manufactured by Mr. David Stoddart, who has recently removed his machine works from Mission street to Pine near Front street. This tool commends itself to the mechanics in this State, who may not have steam or other power—it being a formidable hand drill. It is simple, strong, and convenient for transportation. Mr. Stoddart is successfully employed in erecting machinery of every description, and since his removal his facilities for doing work in the finishing department cannot be excelled.

We would particularly call the attention of those who employ steam power, to Giffard's Patent Self-acting Water Injector, for feeding boilers, for which Mr. Stoddart is the agent on this coast. In a recent notice given of this ingenious device, through this journal, we mentioned that it had been attached to several boilers in this State.

The following serves as a few details pertaining to this invention. The discovery is by a French citizen, and Messrs. William Sellers & Co., are the sole manufacturers and licensees for the United States: their circular states that "the Injector is an apparatus which may replace most advantageously all the means heretofore used for supplying water to steam boilers, whether stationary, locomotive, agricultural or marine.

Its application does away entirely with the necessity of pumps for feeding boilers, and the various movements for working them in all classes of engines, and, in fact wherever a boiler is used and steam produced; it is an adjunct to the boiler, and entirely independent of the engine, and is put in operation by simply opening connexions with the boiler; and having no parts in motion it is not liable to wear nor otherwise get out of order.

The size of this apparatus is comparatively small, and its application is rendered especially easy by the fact that it can be placed in any position, vertical, horizontal or otherwise, near to, or at a distance from the boiler, and at any reasonable height above the level of the feed water.

The apparatus is connected with the boiler by two pipes, one leading from the steam space, and the other conducted to the lowest convenient point of the water space; it will operate with steam at any usual pressure, and it will supply itself from the hot well of a condensing engine.

The many testimonials given to this creditable invention by many leading firms and high authorities in engineering, both in Europe and the Atlantic States, are a sure guarantee of what we have said respecting it; and its advantages may be summed up as follows:

1. The saving of the first cost of all pumps, and the parts to connect them with the engine and boiler.
2. The saving of the wear and tear of these pumps, which in locomotives and other high pressure engines, is very considerable.
3. The saving of the power required to work pumps of whatever construction.
4. The elevation of the temperature of the water admitted into the boiler by the steam used, thus preventing any appreciable loss of heat.
5. The advantage of being able to supply water to boilers without setting the steam engine in motion; thus in all cases obviating the expense and wear and tear of donkey pumping engines, and affording all the advantages usually sought in their application.

IMPROVED DRILL, BY DAVID STODDART.

Several steam ship companies on the Pacific coast have already availed themselves of this Injector, and we doubt not its general use and application will shortly ensue.

Mechanics and machinists should not be without the Drill represented hereby; it may be termed one of the most labor saving utensils in existence.

MINING AND CROPS.—All accounts agree, says the Stockton Republican, that in the aggregate there has been no real loss by the flood, though there has been plenty of cases of individual hardship. The yield of the mines will be greater this year than ever known before since '49, and Stockton is near enough to the mines to get the benefit of the abundance. If any one has an idea of going to our mines, he would find this the best of opportunities. It would be a great improvement upon breaking for Salmon River, or any other far off place, which it will cost him a fortune to reach, only to be disappointed. There is good reason to believe also, that we are to have a splendid agricultural season, and have better crops than we could boast of in any previous year, notwithstanding the disadvantages they will labor under.

The tunnel through Mount Ceniz will be seven and a half miles in length. When the works are completed the passage of the Alps will be reduced to twenty minutes.

Guano and Artificial Pearls.

Artificial pearls were invented in the fifteenth century by a Persian artist by the name of Jaqin. These are small heads of thin glass lined in the interior with Essence d'Orient and then filled with wax. But what is the substance called "Essence d'Orient"? This pompous name was invented for the sole purpose of concealing the true nature of the material from which it was prepared. But this material is furnished by a small white fish, the ahlette, very common in the rivers of continental Europe. It accompanies the scales of this fish, and is detached when the scales are rubbed up for a considerable time and thrown into a vase of water. To collect the "Essence d'Orient" the water is poured off from the vase upon a fine hair sieve which retains the scales and allows the water and the product sought to pass through it. The latter sinks to the bottom and is obtained pure by decanting the water. A little ammonia is added to prevent its decomposition.

In one small river, in the department of Meurthe, not far from Nancy, they collect each year 25,000 kilograms of the ahlette, producing 600 kilograms of scales, worth 25,000 francs. All this is employed exclusively in the preparation of artificial pearls.

Nothing is known concerning the chemical nature of this substance which is attached to the scales of this little fish, and no one appears to have devoted any attention to that point. Mr. Barreswil, has however discovered that it is identical with a principle extracted directly from guano by Bodo Unger, which he called Guanine. Guano being an excrement of sea birds, it follows on the one hand that the guanine might be met with in other species of fish besides ahlette—a thing which was to have been expected. Interesting in a physiological point of view, is the question, what is this proximate principle which is not digested and which is found unchanged in excrements after they have been for many ages exposed to the action of the air?

MINING LOSSES, ETC.—We are pleased to notice, that the miners on North San Juan, Junction Bluff and Buckeye Hills have repaired the damages sustained by the late storms and resumed washing. The Middle Yuha Company's ditch continues in good repair. The damage to the mines and ditches are severely felt in this community, as in many cases the expenses were increased, and the income for a time almost entirely cut off; but we are creditably informed that the repairs and refitting have not been near so expensive as was generally supposed they would be. We notice that rumors abroad have greatly overrated them: as, for instance, the Marysville Appeal of January 8th, in speaking of the effects of the storm in this county, says that one of the heaviest damages sustained was the destruction of the Middle Yuha Company's dam, "a very costly structure." We are informed by an officer of said company that their dam was not a very costly structure, as they rebuilt it fully as substantial as before, at a cost of three hundred and seventy-two dollars, and the cost during low water would not have exceeded two hundred dollars.—[Press.]

Eight hundred and sixty-three thousand nine hundred and thirty-three feet of lumber was shipped from San Francisco to China during the year 1861.

Discovery of the Esmeralda Mines.

In a chapter on the Mono section of country, in the Directory of Nevada Territory, we find the subjoined account of the circumstances attending the finding of the Esmeralda mines:

The credit of this discovery is due to J. M. Cory, James M. Braly, and E. R. Hicks, and was brought about in the following manner:

Messrs. Cory & Braly, residents of San Jose, having gone over to Washoe in the spring of '60 on a prospecting tour, which contemplated the exploration of a pretty wide range of country, found themselves prevented by the Indian troubles from extending their inhors beyond the immediate vicinity of Virginia until late in July. They then struck north, and having examined the district about Pyramid Lake to their satisfaction, returned and passed over into the Sullivan District, east of Carson River. Here they fell in with Hicks, who having prospected the country from Oregon down, was still following up his searches for silver, heading south. Having a similar object in view the three formed themselves into a company, and continuing their journey in that direction along the Pine Nut Range of Mountains, to the west fork of Walker River, bent their course east, and pursuing a zig-zag route through the mountains between the forks of the Walker worked their way down as far as Mono Lake. Here they bent their steps to the north-east, and, passing through the Bodey, El Dorado and Mosonie Districts, all being worked to some extent at that time, they proceeded in that direction until they reached the rugged chain of hills west of Walker Lake. Having inspected these and a similar range further east, without meeting with any very encouraging prospects, they determined to go south to the Coso region, then already somewhat talked of, and, if necessary, push their journey the length of Arizona or even Mexico:

For the purpose of getting an extended view of the surrounding country, and shaping their course they ascended a high peak in the Wassuck range of mountains—which, seen a long way off by the traveler approaching Esmeralda, has since very properly been named Cory's Peak. Having from this elevated position determined a route, they entered holdly upon what promised to be a long and toil-some journey through one of the most fearful barren sections of the Great Basin. They had not got far until a want of water compelled them to make a deflection toward the west. Coming upon a spring in a valley-like depression encompassed by steep and rocky hills, they camped for the night. In the morning Hicks, who seems to have been the hunter of the party, started out with his rifle to look for game. Passing over a craggy height lying west of their camp—since known as Esmeralda hill—this man, who had a quick and observing eye, noticed the peculiar appearance of the quartz ledges, here quite numerous, and breaking off some pieces brought them into camp. His companions, better versed in mineralogy, at once detected in the blue streaks that had attracted his attention, the sulphurets of silver, and proceeding to test it, found the metal present in abundance.

With such a prospect, all idea of going on without a further inspection of the locality was of course abandoned. The three went out, and examining the neighborhood found the hills ribbed with quartz veins from top to bottom. Having tested these veins, and found them all more or less impregnated with the precious metals, they took up seven of the number. The spot from which the first piece of rock was taken by Hicks, is in the Discovery Claim of what is now known as the "Old Winnemucca" Ledge, located near the brow and on the west declivity of Esmeralda Hill. This occurred on the 25th of August, 1860, a day that will be memorable as having brought to light one of the richest and most extensive mineral districts ever yet discovered.

Having taken up this small number of claims, acting, under the circumstances, with a moderation highly commendable, these young men hastened to Monoville, twenty-five miles distant, and acquainted the inhabitants with the discovery. On the 30th of August, a company of some twenty returned with them, when a mining district having been duly laid out, and a set of rules and regulations adopted, numerous claims were taken up. This district, ten miles square, was, at the suggestion of Mr. J. M. Cory, named Esmeralda; an appellation that has since gradually extended itself to the county erected from a portion of it by the Legislature of Nevada.

BOILS CURED BY CREOSOTE.—Doctor Lynch, (in the Eclectic Medical Journal,) in treating boils as a kindred disease to erysipelas, says: "In all cases, creosote is an effectual local remedy. It produces a blister, over which forms an eschar, or scab, when the sore readily heals. And I have never known a single failure where the remedy has been applied prior to the formation of a core, or the death of a portion of the areolar tissue. I have broken up whole crops of boils with this agent, without any other treatment. How it acts, or its modus operandi, in these cases, let pathologists determine. But when the tumor has come to a head, as a certain stage of its development, in common parlance is termed, creosote will afford no service; and then supuration should be favored by emollient applications, such as poultices, fomentations, &c., till the core is disengaged, when the ulcer rapidly heals under simple dressing."

PRETTY RICH.—A Carson City correspondent of the Territorial Enterprise gives the following account of what he saw by way of a prospect in the Daney mines, near Carson: In the second gallery, at the depth of 65 feet, I saw some four or five ounces of dirt gouged at random out of the roof of a drift with a jack knife, upon a handkerchief, and saw the same dirt washed out, and candidly believe that one-eighth of the whole bulk was gold. In washing out, gold was visible on every particle of the rock found in the dirt, and some pieces appeared to be half gold. After picking out specimens for the whole party, the remainder was washed down, without grinding and a prospect obtained which estimated at ten dollars.

MINING IN SIERRA.—A correspondent of the Messenger, writing from Morristown says: Mining operations are going briskly forward, much more so than during any previous season. The American company cleans up weekly from two to three thousand dollars from two pipes. Other companies are doing equally as well. Several new tunnels have been started within a few months, with a good prospect of success. The rains have done but little damage here, merely breaking a few ditches. Cannon creek has been cleaned out as clean as a new shot gun, making a grand opening for a swarm of "Jolus" in the coming spring. Several good strikes have been made here this winter, among which was that of two men, who took ninety ounces out of one crevice last week.

MILITARY PHOTOGRAPHY.—The Minister of War always interested in the aid which the art of destruction may draw from scientific discoveries decided, some months since, that in each corps d'Armee there should be an officer skilled in photography, in every campaign he is to follow the expeditionary corps. To this officer are assigned two subordinates in the capacity of photographic aids, and six soldiers are detailed to serve as assistants. The apparatus employed is necessarily limited, consisting of objectives adapted to long distances, and which can be easily packed in a single wagon.

CARIBOO.—A letter has been received at Lillooet Flat which stated that an auriferous creek had been discovered at Cariboo. It is situated some seventy miles from Antler, and the prospects obtained indicate that it contains far richer deposits of the precious metal than any stream yet struck there. The creek is supposed to be the one which was discovered late in the season by John Ross & Co. The men wintering at Cariboo are said to be comfortable, and the weather at the diggings is represented as mild.

AURORA MINES.—E. C. Kely, of this county has received the following from Aurora: We had a return of three hundred and eight dollars in silver, by the Clayton process from the Esmeralda rock, worked at Green's mill; and any quantity of veins here will pay one hundred and fifty dollars a ton in silver. I think we will come up in the world again. —[S. J. Republican.

WASHOE.—We learn from a gentleman just from Washoe, that the quartz mills in that district will be ready to commence business again in about six weeks. The winter has been very severe, and all work has been stopped for a great length of time. Provisions are high and money extremely scarce.

MINING IN PLACER.—At no time during the last eight months, says the Dutch Flat Enquirer, has so much money been taken out as within the last two weeks. The miners have taken advantage of the fine weather since the late storm, and went to work in real earnest.

MINING ON THE OROVILLE BAR.—A large number of Chinsamen are at work on the bar in front of town and are said to be doing well, the recent floods having stripped the bar close to the pay dirt. The bar is good paying ground for anybody to work; good wages can be made by any good worker.

FILEN.—Articles of incorporation of the Sapphire quartz mill and mining company, was filed by the clerk of the County Court, yesterday. The capital stock was seventy-five thousand dollars.

The current value of labor at Salmon river and the neighboring settlements is ten dollars a day. Gold dust is twelve dollars per ounce; and food of all kinds one dollar and fifty cents per pound.

ANOTHER NUGGET.—At Hog's Dry Diggings, near Pilot Hill, Placer county, two boys recently washed out a nugget of pure gold worth \$400.

The State Agricultural Society met at Sacramento recently. Only twenty persons were present, and the meeting was adjourned until April 23d.

The sales of 3000 tons Anthracite, to arrive, which occurred some little time since, and were not made public, are the only transactions of moment which have come to our knowledge. They were effected at \$18 @ 19 ¢ ton, with some slight resales at \$20. Our quotations give a true index of the market.

SPECIAL NOTICE.

HIGHLY IMPORTANT INVENTION IN DENTISTRY.—Dr. D. STEINBERG begs leave to announce to the citizens of this city, that letters patent for his invaluable improvements in mechanical Dentistry were granted him on the 12th of November last.

This invention consists in the application of GUM ENAMEL to gold plates for artificial teeth, and are acknowledged to surpass all others in use, for their beauty, style and exactitude of fit; their weight compared with others, is less but are far more durable by the addition of the gum enamel. Specimens of this valuable invention may be seen and examined at the dental office of the undersigned, No. 648 Washington street, near Kearny. Great care and attention is devoted to the perfect filling of teeth. Tools extracted by the benumbing process.

STEINBERG & SICHTEL,

Practical Dentists,
648 Washington st., near Kearny.

Mining Companies and Associations.

Office Gould & Curry Silver Mining Company.—November 5th, 1861. Notice is hereby given that the Board of Trustees of this company have this day levied an assessment of eight dollars on each share of the capital stock, payable at the office of the company, on or before the sixth day of December next.

JAS. C. L. WADSWORTH, Secretary.

Office of the Gold and Silver Mining Company, San Francisco, October 10th, 1861.—Notice is hereby given, that a meeting of the Board of Directors, held at their office on the 25th inst., an amount of ten cents per share was levied—one half of which he made payable on or before the first day of December, 1861, to the Secretary of the company at San Francisco.

C. S. HIGGINS, Secretary.

Office Bullion Gold and Silver Mining company, Van Horn District, 305 Montgomery street, San Francisco. Notice is hereby given that the regular annual meeting for the election of officers for the ensuing year will be held at the company's office on the first Monday in December next, at 2 o'clock P. M.

T. L. BIRNEN, Sec'y.

Notice.—There will be a meeting of the Sides Gold and Silver Mining company, on Sunday, November 17th, 1861, at 11 o'clock A. M., at the house of M. H. Bryan, Virginia City.

M. H. BRYAN, Sec'y.

GOLD HILL TUNNEL CO.—The meeting called for Saturday, November 9th, is postponed till Thursday, November 14th, 1861. The meeting will be held at the saloon of Webb & Coppers, Gold Hill.

ROBERT APPLE, Sec'y.

Shareholders of the Caladonia Gold and Silver mining Company are hereby notified that a meeting of the Trustees in Gold Hill, on the 4th inst., an assessment of twelve and one half cents per share was levied on the capital stock of said company, payable on or before the 20th inst., to the Superintendent, at his office in Gold Hill, or to WM. B. AGARD, San Francisco.

Shareholders failing to pay said assessment at the time required are hereby notified that so much of their respective interests in said company as will be sufficient to pay their several delinquencies, will be sold at public auction in front of the office of Wells, Fargo and company at Gold Hill, on the 9th day of December next.

By order of the Board of Trustees, Gold Hill, Nov. 4th, 1861.

POSTPONEMENT OF SALE.—The sale of mining ground, at Silver City, by the Kansas Mining company, is postponed until four o'clock, P. M., Tuesday, Nov. 19th, 1861. Sale to take place on the grounds of the company. Delinquents will please take notice and "come to time."

By order of the Board of Trustees, Virginia city, Nov. 9th, 1861.

Office Choller Silver Mining Company, 612 Front street, San Francisco, Nov. 20th, 1861.—The annual meeting of the Stockholders of this Company will be held at their office in this city, WEDNESDAY, December 4th, 1861, at 11 o'clock A. M.

By order of the Board of Trustees, Golden Gate Company, Gold Hill District.

A meeting of the shareholders in the above named company will be held at the office of H. O. Gaylord, in Virginia on Saturday, Nov. 16th, at 1 P. M.

By order of the Board of Trustees, Members of the Senator company, Congress Ledge, Devil's Gate District, are hereby notified that an assessment of twenty-five cents per foot was this day levied by the Board of Directors, payable to the Secretary at his office, in Virginia, on or before the 15th day of November, instant.

By order of the Board of Trustees, L. W. FERRIS, Sec'y.

Office of the Cole Silver Mining Company, 101 Front street, San Francisco, Oct. 25th, 1861.—At a meeting of the Board of the stockholders of the Cole Silver Mining company, held Oct. 25th, 1861, an assessment was levied of one tenth of one per cent. on the capital stock of the company, being fifty cents per share, payable within thirty-five days to the Secretary of said company, at his office in this city. Shares delinquent at the expiration of thirty-five days will be advertised and sold according to the laws of the State of California and the By-Laws of the company.

By order of the Board of Trustees, J. B. COFFIN, Sec'y.

Office Dios Padre Gold and Silver Mining Company, 215 Front street San Francisco, October 25th, 1861.—A meeting of the stockholders of the Dios Padre Gold and Silver Mining company, will be held at the office of the company, on Saturday, November 16th, at ten o'clock A. M. Amendments to the By-Laws, and other business will come before the meeting. By order of the Board of Trustees.

JOS. P. NOURSE, Secretary.

Office Rogers' Silver Mining Company, San Francisco, October 15th, 1861.—Notice is hereby given that a meeting of the Board of Trustees of the Rogers' Silver Mining Company, held this day, an assessment of seventy-five cents was levied on each share of the capital stock, payable on or before the 16th day of November, 1861, at the office of the company, in this city.

By order of the Board of Trustees, JOEL F. LIGHTNER, Secretary.

Office of the Sucker Gold and Silver Mining Company, Nos. 1 and 2, Montgomery Block, San Francisco, California.—Notice is hereby given that the annual meeting of the Stockholders of the Sucker Gold and Silver Mining Co., will be held at the office of the company, Nos. 1 and 2 Montgomery Block, on the first Monday after the first Tuesday of January, A. D. 1862, at ten o'clock A. M. of that day, for the election of Trustees, and for the transaction of other business.

By order of the Trustees, R. H. WALLER, Secretary.

Notice is hereby given to the members of the Arizona company, that there will be a meeting of said company held at the Recorder's office, in Virginia city, N. T., on Saturday the 23rd inst., for the purpose of organizing said company. All delinquents are notified that unless their assessments are paid by said date, their interest in said company's claims will be sold to pay the same.

By order of the Board of Trustees, R. T. SMITH, President Arizona Company.

Office of the Desert Mining company, 509 Montgomery street, San Francisco, Nov. 23d, 1861.—The stockholders are hereby notified that an assessment of one dollar per share on the capital stock of the Desert Mining company, has this day been levied, payable on or before the 28th day of Dec. next, at the office as above.

By order of the Board of Trustees, J. H. LYON, Sec'y.

Notice.—The regular annual meeting of the stockholders of the Cedar Hill Tunnel and Mining Company, will be held at the office of the Secretary, on Thursday, January 24, 1862, at 7 o'clock, P. M., for the election of officers for the ensuing year, and such other business as may come before the meeting.

San Francisco, December 24, 1861. C. L. FARRINGTON, Sec'y.

Office of the (Ross District) Union Gold and Silver Mining company, San Francisco, Dec. 13th, 1861.—The stockholders are hereby notified that an assessment of ten cents per share on the capital stock of the Union Gold and Silver Mining company was levied on the 12th inst., payable on or before the 15th of January, 1862, at the office of the company, 410 Montgomery street.

By order of the Board, C. J. HIGGINS, Sec'y.

Notice is hereby given that an assessment of One Dollar per foot (share) has this day been levied on the ground of the Alhambra Mining company, payable at the office of the company, 815 Sansome street, San Francisco.

By order of the Trustees, J. O. STRAUCH, Secretary.

Office Uphr Silver Mining Company, San Francisco, Nov. 26th, 1861.—The Annual meeting of the stockholders of this company will be held at their office in San Francisco, on Wednesday, December 11, 1861, at 11 o'clock A. M., for the election of officers for the ensuing year, and transactions of such other business as may be presented.

By order of the Board of Trustees, JAS. W. WHITE, Sec'y.

ARRIATIC CO.
POSTPONEMENT OF SALE.—Delinquent stockholders are hereby notified that the sale of delinquent stock advertised to be sold on November 10th, has been postponed until Thursday the 21st inst., at which time all delinquent stock will positively be sold in front of the Secretary's office, at 1 P. M.

By order of the Board of Trustees, JOHN G. GILCHRIST, Sec'y.

A MEETING of the shareholders of the Summit company will be held at the Gold Hill Bakery, in Gold Hill, on Friday, Nov. 15th, at 7 o'clock P. M. Punctual attendance of the shareholders is requested, as business of importance will be transacted. By order of the President, JOHN DOHLE.

SAVAGE Gold and Silver Mining company. A meeting of the stockholders in the above company will be held at 10 o'clock A. M., the 17th day of December 1861, at the office of Leut. Sherwood & Co., in this city, for the transaction of important business. Parties claiming an interest in the above company will please hand in an abstract of their title either to Robert Morrow at Virginia City, to A. K. Head Nevada, or the undersigned before the 14th day of December next.

By order of the Board of Trustees, Wm. M. LENT, President.

Office Crown Point Gold and Silver Mining company, 321 Front st., San Francisco, Oct. 28th, 1861.—A meeting of the stockholders of the Crown Point Gold and Silver Mining Company, for the election of Trustees, will be held at the office of the company, on Wednesday, November 20th, at one o'clock P. M.

By order of the Board of Trustees, O. B. CRARY, President.

Office Crown Point Gold and Silver Mining Company, 321 Front street San Francisco, Nov. 9, 1861.—Stockholders are hereby notified that an assessment of five dollars per share on the capital stock of the Crown Point Gold and Silver Mining company has this day been levied, payable on or before the 10th of December next, at the office, as above.

By order of the Board of Trustees, J. H. JONES, Sec'y.

Office Sierra Nevada Silver Mining Company.—Notice is hereby given that the Sierra Nevada Silver Mining company levied an assessment of two dollars per share, upon each share of the capital stock thereof, on the 28th day of October, 1861, and that said assessment is payable on or before the 2nd day of December, 1861, to the Superintendent of said company, at Virginia City, or to the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees of S. N. S. M. Co. J. H. BREWER, Secretary.

Office of the Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that all stocks on which assessments are now due, and unpaid after thirty days from date, will be advertised and sold, according to the laws of California and the By-Laws of the company.

All parties holding stock of this company are requested to send it in to the Secretary, and receive new stock for the same. By order of the Board of Trustees, JOS. S. HENSHAW, Sec'y.

Office of Great Republic Mining Co., San Francisco, Nov. 9, 1861.—Notice is hereby given, that an assessment of seventy-five cents per foot has been levied upon said stock, payable in equal payments in thirty sixty or ninety days from date, to the Treasurer of the company.

By order of the Board of Trustees, JOS. S. HENSHAW.

Notice.—A general meeting of stockholders, of the New Idria Mining Company will be held at the offices of the company, on the southeast corner of Front and Vallejo streets, San Francisco, on Thursday, the 21st day of November, 1861, at the hour of 11 A. M.

By order of the Board of Trustees, HENRY S. HUDSON, Sec'y.

Notice.—The annual meeting of the Charles Cany mining company, will be held at the office of the company (D. Davidson's room, northeast corner of California and Montgomery street, San Francisco) on Friday Dec. 27th, A. D. 1861, at 3 o'clock P. M. of that day, for the election of officers for the ensuing year, and transaction of such other business as may be presented. A punctual attendance of all stockholders is requested.

By order of the Board, ALEX. FLY, President.

Office of Sucker Gold and Silver Mining company.—Notice is hereby given that the Board of Trustees of this company (formerly the Sucker company, Gold Hill District.) have this day, Tuesday, Nov. 10, 1861, duly levied an assessment of fifty cents upon each share or foot of the capital stock of, or ownership in, said company, payable immediately to the Secretary, at their office, Nos 1 and 2 Montgomery Block, San Francisco, or to J. A. Hobart, Trustee at Gold Hill, Nevada Territory. On default of payment of which assessment for thirty days after publication of this notice, all delinquent stock and ownership will be sold according to law, and the rules and By-laws of the company.

By order of the Board, R. H. WALLER, Sec'y.

Notice.—Notice is hereby given, that Jos. J. DuPrat is the only authorized agent in California, U. S. of America, for the silver mines known as "Mina Rica," "Guasaba," "Fortune," "Santa Cruz," and "Nacimiento," situated near San Antonio, Lower California, Mexico.

By order of the Board, CHAS. J. DUPRAT, EM. LEYA, DUPRAT, SCHMITZ & CO., CHAS. KRAFT & CO., La Paz, Lower California, July 30th, 1861.

For the purposes of reference, the Deeds of the above named mines have been recorded in the city and county of San Francisco, State of California. For further particulars respecting the above named mines, inquire of JOS. J. DUPRAT, 423 Washington street.

Office of the Bullion Gold and Silver Mining Company, 410 Montgomery street, San Francisco, Jan. 13, 1862.—Notice is hereby given that at a meeting of the Board of Directors, held on the 11th inst., an assessment of ten cents per share was levied on the capital stock of this company, one half of which is called forthwith.

By order of said Board, C. S. HIGGINS, Sec'y.

Office Cedar Hill Tunnel Mining company, No. 509 Sacramento street. An assessment of Two hundred and fifty dollars per (original) share has been levied by the Trustees, payable as follows: Twenty per cent. on the 15th of January, and twenty per cent. on the first of each month following until paid in full.

San Francisco January 14, 1862. CHAS. L. FARRINGTON, Sec'y.

Office of the Falls of Clyde Consolidation Gold and Silver Mining Company, New No. 534 Washington street, San Francisco, January 3rd, 1862.—At a meeting of the Board of Trustees of the Falls of Clyde Consolidation Gold and Silver Mining Company, held January 3rd, 1862, an assessment of one eighth of one per cent. on the capital stock of this company—being twelve and one half cents per share—was levied, payable within thirty days from this date, at the office of the company in this city.

By order of the Board of Trustees, W. L. DUNCAN, Sec'y.

Shareholders of the Osceola Gold and Silver Mining company are hereby notified that the meeting of the Trustees of said company in Virginia city, on the 2nd inst., an assessment of twenty cents a share, was levied on the capital stock of said company, payable on or before the 20th instant to the Treasurer, at his office in Gold Hill, or to D. H. Russell, Virginia City. Shareholders failing to pay the assessment at the time required, are hereby notified that so much of their interest in said company as will be sufficient to pay the amount of their delinquencies will be sold at public auction, in front of the saloon of Ludington & Russell, in Virginia city, on Saturday, the 10th day of December next, between the hours of twelve and three P. M.

By order of the Board of Trustees, J. S. WATKINS, Treasurer, Osceola G. & S. M. Co. Virginia city, Nov. 2, 1861.

Notice to Quartz Miners.
The Union Gold and Silver Mining company having opened their mineral lodes in the Ru'sa District to an extent satisfying them of the value of the same, and having contracted for the erection of a quartz mill near said lodes (not exceeding five miles distant) are now desirous to contract with responsible parties for mining and delivering at an early day, at the said mill, not less than one thousand tons of quartz rock. Proposals will be received until the fourteen day of February next. For further particulars enquire at the Office of the company, 410 Montgomery street, San Francisco.

By order of the Board of Trustees, J. H. BREWER, Sec'y.

Office North Potosi Silver Mining Company.—Notice is hereby given, that the Trustees of the North Potosi Silver Mining company, have, this sixth day of January, 1862, levied an assessment of one dollar per share upon each and every share of the capital stock of said company, payable on or before the fifteen day of February, 1862, to H. A. Eastman, at Virginia City, or the Secretary, at the office of the company, No. 40 Montgomery Block, San Francisco.

By order of the Board of Trustees, J. H. BREWER, Sec'y.

MINING AND SCIENTIFIC PRESS.
THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!
Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!
Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!
Will be greatly benefited by its personal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!
This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.
To mail subscribers:—Four Dollars per annum.
Club Rates.
Five Copies for Six Months, \$8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,
Lock Box 537, P. O.
Room 24, (formerly) U. S. Court Building, Corner of Washington streets, San Francisco.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....MARCH 8, 1862.

The MINING AND SCIENTIFIC PRESS published at 522 Merchant bet. Montgomery and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOGRAPHY and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

Business Attache.

W. WATSON, Esq., formerly of Syracuse, N. T., has this day assumed the distribution of the Press in this city, as well as the solicitation of advertisements, job work, engravings, collections and the general business management of this publication. All matters transacted by him for this office, in these branches, have the entire sanction of the proprietor of this journal.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. Having the best legal talent near the Patent Office in Washington City as our associate, we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

REMOVAL OF THE "PRESS" AND PATENT AGENCY.

The business of this office having become quite extensive, it therefore made it incumbent upon us to remove from our offices in the Government House, where we had scarcely room enough to do our regular office business. We occupied said premises for nearly two years, and were really loth to leave them. Circumstance have placed us so that we now can enjoy separate offices for the printing of our MINING AND SCIENTIFIC PRESS; and the applicants for letters patent need no longer be interrupted by the thousand and one inquiries heretofore made, while we occupied said offices.

We have moved our printing rooms to Merchant street, No. 522, between Sansome and Montgomery up stairs, and the

PACIFIC PATENT AGENCY

and the Editorial rooms are now eligibly situated in the former U. S. Court Building, northeast corner of Battery and Washington streets, in room 24. All persons having business with us will favor us with a visit as early as convenient. Letters will be addressed to us in accordance with the above.

Our New Volume.

As will be seen, our present issue begins a new volume of the MINING AND SCIENTIFIC PRESS, fulfilling the third year of its existence. Every one is aware of the difficulties to be encountered in California, in conducting and permanently establishing a journal of this kind. We are a practical utilitarian people, not much given to abstract studies and scientific pursuits. We live for the immediate and present, confining our reading mostly to the current news and passing events of the day. Wherefore it is, that while the daily papers are greatly multiplied, and receive a more liberal patronage than anywhere else in the world, all those devoted to science, education, religion, or any other specific object, are left to struggle as best they may, with a narrow and feeble support. Yet it is obvious to every one capable of appreciating their influences and aims, that this class of journals are hardly less useful than the other, while they are even more indispensable to a solid progress and high order of civilization. But it was not to complain of our meagre support, or advance a claim for superior usefulness, that we set out to speak. We doubt not the former has been commensurate with our merits; and that the latter has been sufficient

ly apparent to our friends and patrons at least. It is of our future purposes and desires that we would now say a word, for we intend to continue the Press as heretofore, the organ of the arts, sciences and inventions, and the special advocate and exponent of the great mining interest, having enlarged our means for increasing its efficiency, and added to our former facilities for giving information. Able writers have been employed to contribute to our editorial and miscellaneous columns, and reliable correspondents engaged to keep us posted on what is transpiring abroad.

Whatever is of interest in the sciences or the useful arts, or new in the world of discovery and invention, we shall hasten to lay before our readers, illustrating by means of cuts, as has been our custom, everything that requires to be presented to the eye for more thorough elucidation. In this respect we intend to spare no pains, having superior artists constantly engaged upon this department of our paper.

To everything relating to California, or coming within the Pacific field of observation, we shall pay special attention. Everything of home manufacture or production, the work of native ingenuity and talent, it will be our delight to notice in the most detailed manner, and with all fit and merited commendation; in a word, it will be our aim and constant endeavor to make the MINING AND SCIENTIFIC PRESS a medium of conveying to the public a knowledge of what the philosopher, the inventor and the artisan, as well as the mechanic and the delving miner, is doing, each in his department, and keep them advised of the progress that is being made in the great republic of arts and letters. With these purposes well carried out, we feel assured that we shall meet with an appreciative sentiment, and receive a liberal support from the people of California, and will close these prefatory remarks to our fifth volume, with the suggestion that this epoch in the history of our journal is a suitable time for those who have never yet taken it to order a copy, and for those whose subscriptions have expired to renew the same.

Patents.—Facilities.

We are gratified to know that the inventors on this coast are not slow to avail themselves of the immense benefits and pecuniary advantages resulting from their valuable inventions, by making early application for patents. We have of late prepared many specifications and drawings, for novel and highly useful inventions. The laws and regulations are now much more desirable than heretofore, and inventors have altogether more security against infringement than at any former period. We have able associates at Washington, and our facilities for expediting patents supercede those of any other agency perhaps in the Union. We are ready at any moment to advise inventors and give counsel gratuitously with reference to the patentability of their discoveries or inventions. Aside from this we devote our entire attention to the promulgation of California inventions, and by bringing these before the people of this coast, through the columns of this paper; should we not be entitled to their patronage, at least in the preparation of their patent applications? especially since a period of from three to four months time are saved in obtaining the same.

Aside from this we wish inventors to know that when they send their applications abroad they are invariably hamboozled out of their valuable inventions, because the agents in the Atlantic States prefer to further the interests of their neighbors and friends. We know already too many such fraudulent transactions as having been perpetrated upon inventors in this State. This evil can only be remedied by inventors calling at this office, where they can superintend the making up of their papers, and before any one else can have a sight at the models or drawings—the papers then go direct by express or mail to the Commissioner of Patents, to Washington, and not as heretofore, first to New York then to Washington.

Our charges are moderate—that is, but a trifle more than New York agents charge, but the economy of time saved make up more than an equivalent. California Inventors should encourage home institutions.

A Word of Caution to Cariboolites.

It is now evident that we are destined to experience, and are on the very eve of another of those mining stampedes, for which California has become famous. During the short history of this State, our people have been victims of at least 5 distinct movements of this kind; being on an average about

one for every 2 years of our historic existence; we make no note of those minor excitements, which, though often very mischievous in their effects, have been restricted to particular neighborhoods, and of short duration. We speak only of those wide-spread movements, sweeping the State like a whirlwind, and from which no class or locality has been exempted. Of these we say it has been our fortune to suffer one about every two years since our settlement of the country, it being curious to observe with what regularity this migratory mania returns to vex our people. So uniform has been its periods, one might almost think it grounded in some want of our nature, and its gratification to have become a sort of social necessity. Perhaps those movements at which the press so persistently rails, are, after all, but an escape for the expansive powers of our population—a harmless field for their restless energy and natural love of adventure. If so, we should cease to denounce or deplore them, however they may result in suffering or disaster to those who engage in them.

But it does seem to us that there never was a time when the residents of California had so little reason for leaving it and going elsewhere as at present. Notwithstanding our late losses it is now evident that we are likely to have a very active and prosperous season in every department of business. The great destruction of property will create an unusual demand for labor, insuring certainty of employment, and causing prices to advance accordingly. In this connection we have roads to repair, houses, mills, bridges, dams, fences, to &c., rebuild with an infinity of other extra and indispensable work to be done.

The prices of all kinds of farming produce, owing to the markets being well cleared, and the prospect of a foreign demand are unusually high, stimulating the agricultural interest and calling for additional aid in this department. Our own mines regenerated, as it were, by the floods, hold out new inducements for men to engage in working them, it being the opinion of those best acquainted with the subject, that they will pay better this season than they have done for the past six years; even now, claims are more easily to be obtained, and excellent wages are being realized in some of the old and exhausted river diggings. On some of the bars we hear of regular '49 strikes being made, and gold dust is beginning to arrive more freely than during a corresponding period for several years previous.

With all these avenues for certain and profitable employment open our laboring men should see to it that they are not drawn away by the flattering but often ill founded reports of rich mines in Oregon and British Columbia. Let them recollect how small a proportion of those who are constantly roaming about in search of better diggings have ever accumulated anything, while the contented and stable have almost always grown rich. How many of the adventurers in Cariboo last summer, think you, came out of the mines with anything more than they could have made here in California? Not more than one in a dozen, we venture to say; and it is hardly to be supposed that the chances of success will be as good there this season as last. If we assume that one out of twenty will make a fortune there this year, it will be a very liberal estimate. It should be borne in mind that it is only the big strikes of which anything is ever heard. These, even supposing them to be in all cases authentic, are seized upon by interested parties and duly paraded before the world, while the innumerable cases of failure are neglected or carefully concealed from the public.

Let us think for a moment how many there are interested to mislead the working classes in a matter of this kind. The steamboat and stage men, the hotel keepers and all others living out of the traveling public, both here and to the north, are directly concerned in getting up an excitement and setting the masses in motion. How easily this is to be effected through the newspapers is well enough understood, and always in a manner that leaves it difficult to know where the responsibility should attach. Nine-tenths of these extravagant stories are based upon mere supposition or hearsay, the authors well knowing that a loose statement of this kind has the effect to poison the popular mind as readily as if authenticated by facts and figures, while it relieves them of all accountability in the premises. If there is an excitement and a rush towards any specific point, let but the newspapers open their columns to designing speculators, and irresponsible scribblers' and the work is done. Henceforth it is useless to caution—vain to interpose; the humbug has been inaugurated and must have its day.

It would seem that it were almost too soon for our people to have forgotten their Frazer River experience. How confident were the thousands who trooped off to that country in the spring of '58. They had been diddled before, that they were willing to admit; but this time there was no mistake. They had proof cumulative and positive. To use the nasty slang of the day they "had the dead thing," and were willing to "go their pile on it." They had been "sucked in" by the newspapers aforesaid, and would trust them no longer. Now they were going to look to private letters for information and guidance. Confidential epistles from "honest miners" of the Frazer River, to partners or cousins in California, advising them to abandon every thing and hurry up there, were their channels of enlightenment. Could anything be more conclusive and satisfactory? Here were the letters, not decked with printer's ink, but the veritable manuscript, circulating through the camps with the writer's name attached; and yet with all these precautions and assurances, how completely was nearly every one disappointed with Frazer river, though these diggings were, as compared with Cariboo, almost at our very doors. If such "things happened in the green tree, what may be expected in the dry?"

Verily those contemplating a trip to these far off northern regions, should pause and think: think how little they really know of these new mines, how difficult to be reached, how short the season, and how uncertain the chances of success; while, on the other hand, our own State, with new inducements and increased demands for labor, offers a sure and remunerative field for all seeking employment. On the one side is danger, expense, contingency and delay, on the other security, certainty and economy of time, presenting an alternative which the wise and prudent will hardly fail to choose.

A New Route to Salmon River.

We see it stated that a party are talking of starting from Carson Valley to proceed overland by way of the Humboldt to the Salmon river mines. This, to those residing east of the mountains, we should say, presents an easy mode, as well as eligible route for getting into that region, since Salmon river cannot be over three hundred and fifty or four hundred miles due north of the Humboldt, and about five hundred and fifty from Carson city. Parties going around by sea, and traveling as far as they can by water, will still have a long land journey to make, being obliged to hire or purchase animals for accomplishing it. By taking their own animals and proceeding overland, they will arrive in the mines as early as any work can be done, have the means of traveling about at their command, and will have prospected a large scope of country, now supposed to contain placer diggings.

It is true, the region lying between the Humboldt and the Salmon rivers may be called unexplored, our knowledge of it at the most being very limited; still Fremont's expedition and others having crossed over it, shows that it is not impassable, while there is good reason for believing it abounds with mineral wealth, and to some extent in agricultural resources.

From the reports of Nighteagill, Degroot and others, who have penetrated the southern portion of this country, we gather that some parts of it at least are a fine farming and grazing region, abounding with grass and water, and capable of supporting a large permanent population. For a hundred miles to the north of the Humboldt many streams of good water and extensive grassy bottoms and little meadows are met with, rendering the country, which consists of alternate mountains and plains, not only passable but altogether inhabitable. At this distance the waters begin to flow towards the north, making their way to Snake River, the great southern branch of the Columbia, or, as is more generally supposed, into an unknown stream, which, arising in the Oregon mountains, runs south, and finally sinks in the desert. These streams, the water of which is generally cold and wholesome, are lined with Balm of Gilead and cottonwood trees, and filled with speckled trout. Vegetation is said to be two months earlier here than in Carsona Valley, the blue joint covering the bottoms and the bunch grass the hills, sufficient to afford good pasturage, even in the month of April.

According to these accounts this country would by no means be a difficult or dreadful one to pass through, and considering the chances that exist for mineral discoveries within

it, we should suppose there were many inducements for hardy and enterprising men to take it in their way to the Nez Perces and Salmon river mines.

Trials of the Whitman Coal.

We learn that experiments have recently been made upon the Whitman coal in this city, with a view to testing its capacity for generating illuminating gas, all of which have resulted in the most satisfactory manner. Some of these tests were instituted by Dr. Isaac Rowell, Professor of Chemistry in the University of the Pacific, who found this coal to abound in carbon, and to be well adapted for the above purpose; he also pronounces it a superior article of fuel. Mr. Montanden, a Frenchman of scientific attainments, has also subjected it to trial with like results. He pronounces it to contain a certain percentage of carbon and bitumen, burning with a bright lively flame, and leaving but a small residuum. He says it is excellently well suited for creating steam or making gas. As soon as the roads improve a quantity of this coal is expected here, in order that the public may see what it is like, and for the purpose of being subjected to still further experiments.

Three companies were incorporated by the Legislature of Nevada Territory at its late session, the one for supplying Virginia, the other Carson, and the third Gold Hill and Silver City with gas, the whole being based upon the previously ascertained fitness of the Whitman coal for the manufacture of this article. These companies are required by the terms of their charters to commence their works within a period varying from six to ten months, and to complete them within two years, and in the case of the Virginia company, of twenty months, all of which will no doubt be accomplished, the enterprise in one or two cases being already well advanced. It is calculated that the inhabitants of Virginia will be supplied with this gas, and the streets of the town be illuminated by means of it, within the next ninety days.

Panorama of the Seat of War.

Our obligations for the above series of charts are hereby tendered to Mons. Adrien Gensoul, of Montgomery street, in this city. This enterprising importer of prints, engravings, lithographs, etc., is constantly in receipt of the latest European and American publications. The charts representing the seat of war are the work or compilation of Mr. John Bachman, of New York. They are printed in two tints, and give one a complete topographical view of the entire Southern States.

The execution of these maps is not only artistical but novel, and we doubt whether any maps of any country have ever been thus illustrated. These charts we have had framed, and they now grace our sanctum.

Mr. Gensoul is now extensively engaged in the book trade, and keeps artists' colors and utensils of the best make. We recommend him to our many patrons.

Geological Lecture.

We listened the week before last to the lecture of Prof. J. D. Whitney, delivered at the Assembly Chambers, in the premises of this journal. We did hope that a more detailed synopsis of geological facts pertaining to this State would occupy the lecturer's discourse, in which, however, we were disappointed.

The lecture was well received by the limited audience present. No doubt the inclemency of the season caused many to remain in doors. Prof. Whitney's discourse was principally designed to give an outline or synopsis of geology generally, and allude occasionally by way of similarity of like circumstances on facts to California, when speaking of other surveyed or explored countries. On a former occasion we published the professor's lecture in full, which privilege, we are sorry to say we must this time forego. Our dear readers may some day hear it from the author himself, or through some publication specially designed. Our daily papers have given a synopsis, which it is needless for us to repeat.

Valuable Manuscript Map.

Since writing the paragraph in our present issue relative to the overland route from Nevada Territory to the Oregon mines, we have been shown a manuscript Map of the region to be traversed, from which we infer the route is not only feasible, but highly practicable. This Map, gotten up by a gentleman who has traveled much over that Territory, and is altogether well informed as to its topography, indicates a finely watered open country in that quarter, with few obstacles in the way of travel. The hot and arid deserts which cover most of the Great Basin, rendering a passage over it tedious and perilous, do not extend into this northern section more than fifty or sixty miles beyond the Humboldt. After reaching that point the country is more fruitful and the climate more equable, being a good deal like that of Northern California.

From an inspection of this very valuable and interesting Map, we infer that Northern Nevada and Southern Oregon, on this meridian, is not the mere Terra Incognita that it is set down for, on all the charts extant; and we know of no portion of the Pacific coast that calls for the publication of a map at this time so much as the region in question. All that we have known of it, until very recently, has been the little gleaned from the vague and meager reports of exploring parties who have made flying trips over one corner of it, and the still less reliable accounts of the few trappers who visited it at an early day in search of peltries and furs.

It strikes us that some of our enterprising publishers could hardly do a better thing for themselves, while they would render the public an essential service, than to secure this manuscript and have it lithographed at the earliest practicable moment. The purpose of a great Northern Hogra is swelling in the popular mind and growing every hour. We may counsel and direct, but we cannot stay or divert it from its end. Thousands and tens of thousands, for better or worse, are going to transfer themselves from this State to Oregon the coming summer. They will go; wherever it is desirable they should not with all the light and knowledge within reach. And, as there seems a strong probability of there being a good route leading through the region referred to, with a fair chance of finding rich mines by the way, we deem it important that every facility be afforded these adventurers for acquainting themselves with the intervening country, and the various avenues leading to this new land of promise. Northward our people will go. The south, and to some extent the east, must for the present stand in the background. Arizona, New Mexico, and even Nevada, will for the time being be ignored by our fickle and roving population. "Forward to Oregon and Cariboo!" will be the advancing signal of thousands the next three months, while Washoe and Co. will be so poor that few will do them reverence. Wherefore, we repeat, a map illustrative of the routes leading into the land towards which all eyes are turned, would at this time be most desirable and opportune.

We believe it is not the intention of the gentleman owning this manuscript to publish it at present, but doubt not he might be prevailed upon to do so, or to part with it for that purpose, in view of the reasons above set forth. It includes the whole of Nevada Territory and a portion of Southern Oregon, and for completeness far exceeds anything ever yet published on these countries. If brought out at this juncture in good shape, it could not fail to prove a pecuniary success, as well as a public convenience and a creditable addition to our geographical literature. A skeleton draft of this Map having been furnished the Legislature of Nevada Territory, drew from that body a vote of thanks to the author—the members, coming from all parts of the country, approving its plan and endorsing its correctness.

The Ericsson Iron Battery.

The hull of the iron battery now in process of construction at Green Point, by C. S. Bushnell & Co., under the direction of Capt. Ericsson, is nearly completed, and the battery will probably be finished by the middle of January, as required by the terms of contract. It will not be accepted by the government if, on being subjected to the enemy's guns at shortest range, it fails to fulfil the pledges of impregnable made in regard to it. The hull is sharp at both ends, the bow projecting and coming to a point at an angle of eighty degrees, to the sides inclining at an angle of fifty-one degrees to the vertical line, flat bottomed, six and a half feet in depth, built light, of 3-8 inch iron, one hundred and twenty-four feet long, and thirty-four feet wide at the top. Another or upper hull rests on this, with perpendicular sides and sharp ends, five feet high, forty-one feet four inches wide, one hundred and seventy-four feet long, extending over the sides of the lower hull three feet seven inches, and over each end twenty-five feet, thus serving as a projection to the propeller, rudder and anchor. The sides of the upper hull are composed of an inner guard of iron, a wall of white oak, thirty inches thick, covered with iron armor six inches thick. When in fighting order the lower hull is totally immersed, and the upper one is sunk three feet six inches, leaving only eighteen inches above water.

The battery will draw ten feet of water. The interior is open to the bottom, as in a sloop. The deck comes flush with the top of the upper hull, and is bomb-proof. There will be no railing or bulwark of any kind above the deck. The inclination of the lower hull is such that a ball, to strike in any part must pass through at least twenty-five feet of water, and then strike an inclined iron surface at an angle of about ten degrees. It is therefore absolutely protected, yet so light as to give great buoyancy.

Only three things are exposed above deck. In case it is boarded no harm is done. The only entrance is at the top of the turret, which cannot easily be scaled, and even then but one man at a time can descend. Two hundred men are now constantly employed on the vessel. The engines have been placed in it. Two columbiads will be mounted on the turret, and a test of the impregnable of the battery will be made in front of some large rebel battery. If its offensive and defensive capabilities are satisfactory, it will be turned over to the government.—[N. Y. World.]

[Our telegraphic advices mentioned that this famous battery was successfully launched on January 30th. It was understood that it would be ready for service in a week afterwards. In the meantime Commander Worden and Lieut. Green had been ordered on board. This novel battery is said to be in great favor at Washington.—Ed. Bulletin.]

The National of Grass Valley, says that there are now some 1,500 hearty miners out of employ in that locality, which is a loss of about \$4,000 in matter of wages alone; and this, added to their losses, will run the total loss up to \$10,000 a day.... An individual called "Oregon Jim," was badly sold last week, at Rough and Ready, by some operators who wanted to get to go to Salamon River. They gave him one or two genuine \$20 pieces, which they represented to him as bogus, but which he found to take so well that he gave them \$350, a horse and watch to get a fresh supply from below—they represented to him that the article could be bought for \$250 apiece. Of course, they came back!

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends they wish disinterred, are informed that I have the most complete registry in existence of graves in that cemetery, having added to my own records by purchase, the books of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miners Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer: together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notices about the method of reducing the metals. The third chapter of 39 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seven pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for banding and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

A BOOK FOR THE MINER.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character: and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

NEW AND VALUABLE MINING BOOK.—We have been presented with a mining book, just published by the enterprising publisher and proprietor the "Mining and Scientific Press" of San Francisco. The title of the work is the "Miner's Companion and Guide, and treats of California Mines exclusive. It will prove a most valuable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and I doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout our mining towns for its merits and lucidness. We earnestly commend it to those who are practically interested in bringing to light from Mother Earth (aged gold) its hidden treasures.—[Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 3 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty two per cent., against two per cent., wasted by our brand mint. The total expenditures for three years under Messrs Birdsall & Lott, amounted to the large sum of \$1,019,273.99. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of this state at large. The charges are as follows:

For parting silver from gold when gold is below 300—1000ths. fine. 3cts per oz
" from 300—1000ths. to 750—1000ths fine. 7cts " "
" " 750—1000ths to 950—1000ths " .14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " " "

DEPOSITS FOR FINE BARS.

\$1 16—4—11ths cents. per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16—4—11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16—4—11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register as most congruous with the physical aspects of the material but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rate, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to the extensive establishment, we can confidently announce to the public at we now have
the Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and capacities; Stamp shoes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flaming Mills; Gang, Ash, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines has been in operation at McCall's mill in this city.

Knot's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia iron. Dr. Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Nut Mills; Roller Fronts; Wind Mills; of Hunt's, Johnson's and Lam's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This Mill will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartley Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE PATENT OFFICE, AND FOR MORE THAN ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS, AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the Inventors of the United States

ap25

CHLESAR MASON

PACIFIC METALLURGICAL WORKS.

NORTH BEACH,

Are now prepared to reduce by contract, Gold or Silver Ores or Sulphure Price of reducing will be as low as the charge of similar establishments Europe or in the States, thereby saving freight, insurance and interest.

BRADSHAW & CO., Agents,
Cor. California and San.

LEWIS COFFEY & RISDON'S

STEAM BOILER AND SHEET IRON WORKS.

The only exclusively Boiler Making Establishment on the Pacific Coast Owned and conducted by Practical Boiler Makers. All orders for New Work or the repairing of Old Work, executed as ordered, and warranted as to quality.

Old Stand, corner of Bush and Market Streets.

Opposite Oriental Hotel, San Francisco, Cal.

LEWIS COFFEY,

J. N. RISDON

An Important Invention.

Giffard's patent self-acting water injector, for feeding boilers has recently been introduced into this State, and been found to work in a satisfactory manner on steamers, in supplying the boilers with water. This instrument is for the use of steam boilers, stationary, locomotive, agricultural, marine. It works independent of the engine, and is put in motion simply by connection with the boiler. The size of the apparatus is small, ornamental in its appearance, and can be placed in any position for use. It is connected with the boiler by two pipes, one leading from the steam space and the other conducted to the lowest convenient point of the water space.

One is on board of the steamer Swallow, plying between this city and Sacramento, which the engineer, Mr. Samuel informs us works like a charm. It is found very useful in traversing a river like that between Marysville and Sacramento; as, during the lower stage of water a vessel is liable to stop upon a bar, and the boiler can be supplied with water without the motion of the engine. Mr. Hulse, who is an engineer of much experience and stands very high in his profession, is favorably impressed with the apparatus, and expresses himself somewhat surprised it had not been introduced in California at an earlier period. It is in use on the steamers Webber and Sophie McLane, on the lower waters of the State; also in Corlys's mill at San Jose. We are informed it gives the utmost satisfaction wherever introduced. Thirteen different sizes are made at prices ranging from fifty to four hundred and seventy-five dollars. That used on the Swallow is No. 6, which cost one hundred and twenty-five dollars. David Studdart is the agent, San Francisco.—[D. C. Express.

Mr. C. H. Miller, of Mossman & Miller's Express, says the Washington Statesman, gives us a few items from the mines. He states that the snow is from ten to fifteen feet deep on the mountain from Slate creek to Florence, but travel in and out has been constant enough to keep the trail in a passable condition for animals. Provisions seemed to be plenty in the mines. No mining is being done, excepting an occasional attempt by some, with the use of fires, and the constant application of hot water to keep the rocker free from ice. At the mouth of Slate creek Mr. Miller met a party just in from a point above that place on Salmon river, who reported the discovery of better mines than those in the neighborhood of Florence. They had quite a large quantity of gold, a specimen of which, worth four dollars, the expressman brought down. They came down to the mouth of Slate creek for provisions, and immediately returned. The precise situation of these diggings could not be learned from the discoverers.

LATER FROM SALMON.—A man named Reese, from Salmon river, came down with the messengers. He took up a claim in the Summit district, about the first of November, and with three others, took out ten thousand dollars in six weeks. Mr. Reese left Salmon on the 16th of December. He says, at that time snow in the diggings was three and four feet deep, though many, by means of large fires, the tedious process of thawing out, managed to work a few hours every day and do well. New, and it is said, very rich gulches had been discovered, but still numbers were without claims, and almost destitute of provisions or the means to buy them. Mr. Reese declares emphatically that there is nothing whatever to gain by going to Salmon before April. The expense of living at home will not be anything like as great as at the mines, and much unnecessary hardship and expense may be avoided.

GOLD ITEM.—Mr. Wiser of Yamhill county, is a successful gold miner. Last fall with two others he purchased a gold claim on the Salmon river, for which the company agreed to pay six thousand dollars. They worked the claim two months, and his part of the gain were twelve thousand dollars. He left the claim with his partners, who will work it this winter if they can, and, at any rate keep off trespassers. He estimates that the claim will be worth to each of the parties, at least \$100,000. Unquestionably the mines on Salmon river are wonderfully rich. They throw all the big Cariboo stories into the shade. But only one question of importance remains: Are they extensive? The appearances of the country would indicate that they were; but the fact is yet to be ascertained.

"TAILINGS."—Five men started yesterday in a large hox led for the Salmon mines. They expressed a determination to go through or perish in the attempt. The fate of poor Jagger and his companions had no effect as a warning against the rash undertaking.

A correspondent writing from Silver City, Nevada Territory says wages will be very high during the coming spring and summer, owing to the many vacant places left by those leaving for Salmon River mines.

Messrs. Adams & Bro., on Washington, below Kearny street, have just brought out the new style of hats for March. We have one of them and can say that it fits well, and is made of good material. Adams & Bro. are famous for producing a neat and cheap "tile," and we therefore recommend them to our acquaintances and friends.

CALIFORNIA MILITARY CLOTHING FACTORY.

Messrs. Lockwood, Ewell & Co., whose extensive stores, formerly situated 626 Clay street, and 631 Merchant street, in this city, are now removing their entire stock of fashionable garments, furnishing articles etc., to the newly fitted store, northwest corner of Merchant and Montgomery sts.

Among merchant tailors this firm have established for themselves an enviable reputation since they commenced, which was in 1857. We are creditably informed that these gentlemen have thus far made nearly all the costumes of the military officers in this State, since they keep every article requisite for a full uniform.

Another leading feature in this firm is that Mr. Lockwood is the residing partner in New York, No. 440 Broadway, from whence the house here is regularly supplied with fashion plates, including the fabrics and merchandise belonging to the new modes. But the house also send ready made clothing to the branch firm here, the style and quality of which favorably compares with the best ordered articles in this city. Such being the immense advantages, this firm have concluded to remove to a more prominent business locality, since Clay street has lost in a measure its commercial grandeur it at one period richly merited. Messrs. Lockwood Ewell & Co. will open one of the richest stocks of goods, at remarkably reduced prices ever offered here, and we request our patrons to encourage this enterprising firm, whose interests are closely identified with California. We wish them success in their new premises.

CALIFORNIA AND OREGON S. S. LINE.

—FOR—

Eureka, Trinidad and Crescent City, Touching at Mendocino

The Steamship

COLUMBIA,

FRANCIS CONNER—Commander,

Will leave Folsom st. Wharf for the above Ports,

SATURDAY.....MARCH 8, 1862,

At 2 o'clock, P. M.

For freight or passage apply on board, or to

HOLLADAY & FLINT, Proprietors.

Office 407 Washington street, opposite the Postoffice.

Bills of Lading will be furnished to shippers of cargo. No others will be signed.

REMOVAL OF THE DEAD

From Yerba Buena Cemetery.

AS THE DEAD IN YERBA BUENA CEMETERY WILL BE REMOVED in a short time by the authorities, those having relatives or friends they wish disinterred, are informed that I have the most complete registry in existence of graves in that Cemetery, having added to my own records, by purchase, the books of the late City Sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges.

Everything requisite for Funerals supplied at the shortest notice.

NATHANIEL GRAY,

General Undertaker, 641 Sacramento street, corner of Webb,

Between Kearny and Montgomery.

Established in 1850.

m8 tf

WHILE YOU HAVE THE MONEY,

MAKE SURE OF A HOME!

NEVER HAZARD THE LAST DOLLAR!

To Cariboo and Salmon River Miners, and all other who wish to purchase LOTS in San Francisco with PERFECT TITLE:

ED. The undersigned will sell Building Lots for from \$10 to \$200. Also 50 vara Lots and entire Blocks of the most beautiful gardening lands in the city and county of San Francisco, on the line of and at the WEST-END OF THE SAN FRANCISCO AND SAN JOSE RAILROAD. Persons desiring to invest a few dollars, or hundreds, or thousands of dollars, would do well to call on the undersigned, AS HE DEALS ONLY IN LANDS WITH A PERFECT TITLE, to wit: those held under

A PATENT OF THE UNITED STATES!

Persons residing in the interior, or who are about to go to the Cariboo & Salmon River Mines, can purchase this property and leave it without any fear of adverse claims or titles springing up in their absence.

The undersigned will, if desired, give his personal attention to the assessing, paying of taxes, etc., on all lots purchased from him, and will forward to each non-resident purchaser his tax receipts, free of all cost save the actual amount of the taxes.

Office—No. 19 third floor of Naglee's Building, (south west corner of Merchant and Montgomery streets.)

HARVEY S. BROWN.

STEAM SASH, DOOR AND BLIND FACTORY.

STEVENS & HOFFMAN, Proprietors.

THE ABOVE FACTORY IS NOW READY TO RECEIVE ORDERS AND to do work with dispatch in the following branches:

Making Sash in any style or shape required; Doors of any size or style; Mouldings of any pattern.

SCROLL SAWING AND TURNING.

Packing Boxes Made to Order.

All kinds of finish for Building—such as Architraves, Doors, Jambs, Bases with moulding on the edge—any pattern that parties may desire.

Also, Ceiling, Tongued and Grooved Flooring, Planing, Sawing, Sidings.

PANEL LUMBER PLANED.

Boards and planks split, Furrings, Battings, &c. &c. In fact, we are prepared to furnish all materials for Building in our line, in a manner to save one-half in work and expense to the contractor. We are also prepared to do any

Sawing or Planing for Steamboat work,

that may be required; and from our experience in the business, and having obtained the

LATEST IMPROVED MACHINERY,

we feel confidence in informing the public that we can supply any of the above articles at the shortest notice, and at

SAN FRANCISCO PRICES,

(Less Freight and other Charges.)

We shall keep on hand a full assortment of Lumber and articles suitable for the trade, all of which we offer for sale very low for cash.

STEAM POWER TO RENT, with or without shop room, if applied for immediately.

STEVENS & HOFFMAN,

Corner Government and Wharf streets, near James Bridge, Victoria.

m8-3mott

GEO. W. CHAPIN & CO.,

EMPLOYMENT OFFICE AND GENERAL AGENCY,

Lower side of Plaza, near Clay street, San Francisco,

FURNISH ALL KINDS OF HELP FOR FAMILIES, HOTELS, FARMERS, Saw Mills, Mills, Factories, Shops, etc.

Also, have a Real Estate Agency, and attend to business in that line, Negotiate Loans. Buy and sell Property of all kinds, etc.

A. S. HALLIDIE.

H. T. GRAVES.

A. S. HALLIDIE & CO.,

WIRE SUSPENSION BRIDGE BUILDERS,

and Manufacturers of

PATENT WIRE ROPE.

WIRE Suspension Bridges of any span and capacity erected, and material furnished.

Having been constantly engaged in the erection of Wire Suspension Bridges and Aqueducts for some years past, we are fully prepared to do such work satisfactorily at a low figure, and to guarantee PERMANENCY.

Parties who are about erecting bridges will find it greatly to their advantage to give us a call before deciding to build wooden structures, as the recent floods throughout the State have proven them to be wholly unsafe and unreliable. A number of our wire suspensions are now in use in different localities throughout the State, no one of which has been in the least affected by the freshets.

WIRE ROPE, for mining and ferry purposes, manufactured of any length and size required, being cheaper and better than hemp.

Scales of weights and strength with prices, furnished on application to the manufacturers. Send for a circular.

M1.

A. S. HALLIDIE & CO.,

412, Clay street, San Francisco.

GRAY & TRUE, UNDERTAKERS,

WOULD RESPECTFULLY INFORM THEIR FRIENDS and the public generally, that they have opened Coffin Warerooms at No. 21 Geary street, near the Market street Railroad Depot, corner of Kearny street, where they keep constantly on hand a large assortment of Rosewood, Walnut, Mahogany and plain coffins. Everything requisite or funerals furnished on the most reasonable terms.

Particular attention will be paid to putting up bodies in lead coffins, the only safe and reliable method of shipment to the Atlantic States.

Also the removal of the dead from Yerba Buena Cemetery personally attended to.

VOL. V. SAN FRANCISCO, SATURDAY, MARCH 15, 1862. NO. 2.

Salmon Mines.

A cotemporary has the following interesting correspondence from a miner at Salmon River, who gives his opinion of the country as follows: "This whole country is very spotted in gold, and taken altogether is a very poor country for a large number of miners. A few men might do well enough, but a rush cannot help but bring with it great suffering. And although I know, as I said before, that it will have no effect, I cannot help but advise Californians to stay at home; but if they must come, a few words from me, by the way of advice as to the route, and the time to start, and I am done.

I will suppose all your readers to come by water, which is really the only practicable way. Steamers should come up the Columbia as far as the Cascades, and deposit their passengers and freight. From the Cascades to the Dalles passage is at present \$4.00; freight about twelve dollars per ton measurement. From the Dalles take stage to the Des Chutes tree dollars—distance, fifteen miles; thence steamer to Lewiston, for about thirty dollars. Thence there is always passenger trains to the various diggings, fare fifteen to thirty dollars.

The 1st of May is early enough to leave California. There is no work done, especially in Salmon River before the 1st of June.

The present winter has been an unusually inclement one, now commenced falling in the mines the 1st of October, and was about six feet deep when I left Florence city (Salmon River mines) on the 10th of December. Snow fell at its place (Dalles) to the depth of two feet, and has lain since Christmas. The river closed on the first day of January, and remained closed until yesterday.

We have already heard of several deaths from freezing, and I have no doubt that at least one hundred men have perished from the cold in the upper country this winter. The suffering in Salmon River must be immense, as not more than half the mines are properly supplied with clothing or bedding.

Cariboo.

We have seen a letter from Maj. Downie, written at Victoria, Vancouver Island, in January. He has been at his tricks for the past three years—prospecting; and has traveled over almost or quite every part of British Columbia, suspected of containing gold. He has claims at Williams creek, which he purposes prospecting the coming summer, and which he has strong belief in.

In examining the hill he has found the stratum of trap, which in this country overlies the famous Blue lead, and the Major is confident of finding good pay. He says the mining season is of three and a half to four months duration. Prospecting is difficult and laborious. The placers are swampy and difficult to get about in.

Some rich deposits have been found, but the Major admits that he has seen nothing to compare with his old town, the north and south forks of the North Yuba.

A calm perusal of the letter would incline one to look upon it as the expression of a forced content—the reflections of a subdued adventurer, philosophically looking upon the dark side of a dark picture. He talks off, for instance, of mining. Says the best openings there are to cultivate are [in a three and a half months summer!] and raise and pursue the mechanic arts. There is nothing in the letter calculated to induce any one to leave this section for the North.—[S. Democrat.]

ANNEL coal has been discovered at Crab Orchard, Ky., where troops there, and the inhabitants are astonished at it. A man said that several years ago he had dug a well on an adjoining farm through the "same sort of stuff," but it had occurred to him that it was canal coal.

Colorado Mines.

From our friend Dr. Chase, who has just arrived from the Colorado mining district, we have the following intelligence: The companies are generally doing well, and a vast amount of valuable ore has been taken out.

The Silver Age company own the Mohawk and Morning Star veins—prospecting \$800 in gold to the top, and 33 per cent. silver.

Los Angeles lead assays \$300 to \$400 in gold, and \$400 in silver.

Queen City—\$1200 in silver and gold.

Buena Vista company owns three leads, which all turn out very rich argentiferous galena.

The Fairview and Mandeville leads are also doing well.

The Telegraph company own three veins—Trinidad, Bella Union and Telegraph—prospecting well in gold and silver.

Spitzpah, "living waters," and invincible—argentiferous galena.

The El Dorado company own the Colorado, New Mexico, Potomac, Pioneer, Oliphant and Tehuacan (food)—prospecting as richly as any in Washoe or Esmeralda.

These mines are the lately discovered leads four miles from the banks of the Colorado river, and sixty miles north of Fort Mojave, fifty miles south of Potosi. They are eligibly located, as they can be reached by steam navigation.

Dr. Chase is going to San Francisco for machinery. In a short time there will be a large population at work on the banks of the Colorado. The Indians are very friendly. The Pah-Utes are a little inclined to stealing. They wanted the Mojaves to join them in stealing stock from the miners, but the latter refused, sent word to camp, and offered their services, should stock be lost to clean out the Utes.

The roads to Fort Mojave are very good; the late rains have done them no injury. In the cañon below Camp Cady, about fifteen days ago, the water stood for a short time, but it drained off; and wagons passed without difficulty.—[Los Angeles Star.]

By private letter to the Oregon Gazette, from the Dalles, dated January 23rd, we learn that there is ten feet of snow on the route between there and Walla Walla, and that stages and animals can no longer make trips. The Columbia is frozen over with thick ice, so it is thought the steamers will not be able to run for a month. Our correspondent walked all the way from Portland, and advises all to refrain from following his example. He expected to be able to leave the Dalles for Salmon River in about a month, and not before on account of the destruction of the road by snow. Six hundred pounds of gold had reached the Dalles from Salmon a few days before. Reports from the diggings were very favorable. From a town resident we hear that John Young, formerly of Logtown, had visited new diggings on Powder river and beyond Fort Boise, which were very rich. He had gone to Washington county to winter, and would start with a party to the new mines early in the spring. He strongly advises his old comrades about Logtown to join him. The best route from California is by Rogue River Valley.

HOLD—DON'T BE IN A HURRY!—A correspondent writing from Portland, Oregon, says that there is not the remotest possible chance of reaching the Salmon river mines before the middle of May. The Williamson river is frozen and will not be navigable before that time. He advises persons intending to make the trip to wait a little while, as they cannot possibly proceed further than Portland, and there is no work to be obtained at that place.

SALMON RIVER DUST.—A sample of Salmon River dust brought to this place by Dr. Franklin, has been assayed by Benj. Needham, an experienced assayer, who says it assays \$13 64 per ounce.—[Portland Times.]

A Just and Well-Merited Tribute.

The "Spirit of the Times," our Sporting cotemporary, pays the following complimentary tribute to two of our quasi, leading journals. On one occasion we saw Editors, Proprietors, Publishers and Solicitors, at Whatcom, W. T. Lots, land and money suffered, all for the purpose of deluding the unwary to that despicable hole, Whatcom; but the wages of sin did not avail aught, since that place has been almost swept from the memory of Frazer Riverites. Bornek, says:

We were rather amused on reading in the Alta of Sunday last, the letter to that paper "from our own correspondent," Alfred S. Gould, dated at Portland, and speaking of the new mines at Salmon River, particularly, and Cariboo, generally. The most remarkable portion of the letter or we might say portions, was the pertinacity with which the correspondent in question, endeavored to impress the mind of the reader with the fact that he was not deceiving any one. For if he says it once, he says it at least twenty times in the course of that letter. "My whole object is to tell the truth; this is the truth; I am assured it is a fact; no one can pull wool over my eyes; the father-in-law of the President of the steamboat company which carries passengers to the new mines, says it's all right; and of course it's the truth." Oh! Alfred, we are very much afraid the wool has been pulled over your eyes, or there are golden scales upon them, which precludes the possibility of your telling the exact truth in regard to the matter.

Now joking aside; we ask the Alta and the Bulletin, which papers have been foremost in the work of depopulating this State, at a time when the very class who emigrate to the new mines, are the very ones most needed at this time to assist the State to recuperate from the disasters of the past winter; whether they are not betraying the very best interests of California, in the course they are pursuing in this matter? We certainly think they are; and although the Bulletin may publish columns after columns of statistics to show that the late floods did not materially damage the interests of California, yet in doing all in its power to weaken the resources of the State, in the manner to which we object; that journal will be cursed for the "deep damnation of the taking off," of so many hard working, industrious and valuable citizens. The editors of the Alta and Bulletin have no direct or personal knowledge touching the truth or the richness of the new mines; all they know is that at least two hundred and fifty men (if the truth were told,) have perished amid the snows and ice of the passage thither. It has been suggested that a competent committee be appointed by the Chamber of Commerce, to be sent to the locality of the new discoveries and report the result of their investigations; the only fear in regard to the committee is, that the committee might meet with the same truthful Jeemes' which beset our young and unsophisticated friend, Go(u)ld. It has been said that every foot of the Panama Rail Road cost a human life, and we believe that the highway to the new mines will be paved with human bones.

A letter in the Oregon Statesman of the 27th January, says, an old Oregonian, just returned from the Salmon river mines, there are some rich diggings there, but not enough to go around. If 50,000 people go there, as now appears probable, he says about one in fifty will pay expenses, and one in a hundred make a strike.

COLORADO MINES.—Recent reports from these mines state that claim holders are busily engaged in prospecting and developing their recent discoveries. The lodes turn out richer than the most sanguine expected; a few companies have already erected arastras, and we expect are handling the precious metal.

Inventions and Discoveries.

A NEW RIFLE.—Rev. J. D. Moor, of Birmingham, Iowa, has invented a rifle cap, capable of firing forty shots a second. Its calibre is nineteen balls to the pound, and it has the Maynard primer attached. The powder and balls are put into two tubes, which extend from the chamber about one foot up the barrel, parallel with each other, and both can be filled with ammunition in a few seconds. These serve the purpose of cartridge box, and the rifle is charged by a partial revolution of the stock, which is quickly reversed, and the gun is ready for firing. The ball is rammed into the chamber with a sliding hammer, by the movement of returning the stock to its place. The manner of handling may be learned thoroughly in a few minutes.—*Journal*.

BULLET-PROOF VEST.—Col. Cass of the 9th Massachusetts Regiment, received a newly-patented bullet-proof vest. Externally it has the appearance of an ordinary army vest; but there is a lining of double wire net work, that not only seems impervious, but upon actual experiment proved to be so to shots from a revolver at 10 paces. The vest weighs 3½ pounds. Officers and men examined it with curious interest. The men say however, they are willing to risk their heads, necks, bodies, and all, against the shots of the rebels, if they do not shoot better than in their recent battles. This regiment, although the second regiment enlisting for three years from Massachusetts, has lost but one man by death, and there are now only 15 excused from duty on account of sickness. There is no regiment in the Potomac army that can present such a healthy record.

The following are the dates of some of the most important inventions and discoveries: Glass windows first used, 1198; chimneys in houses, 1226; leaden pipes for conveying water, 1253; tallow candles for lights, 1290; paper first made from linen, 1302; woolen cloth first made in England, 1331; printing invented, 1449; watches made in Germany, 1470; variations in the compass noticed, 1532; pins used in England, 1540; circulation of blood discovered by Harvey, 1619; first newspaper published, 1637; first steam engine invented, 1749; steam engine improved by Watt, 1763; steam mill erected, 1783; stereotyping invented in Scotland, 1785; animal magnetism, by Mesmer, 1789; invention of the electro-magnetic telegraph, by Morse, 1843;

More about Salmon River.

By the Cortes, yesterday, we received files of Oregon papers. Some of them are filled with all sorts of extravagant accounts about the richness of the newly discovered mines at Salmon river. We make the following extracts from a letter published in the Portland Times of the 17th, and signed by "W. B. Park, Salmon River Butcher." He says:

"I have just arrived here from Salmon mines, having left the diggings Dec. 26th, and visited Oro Fino, en route down, which place I left Jan. 2nd. When I left Salmon there was about two feet of snow, and the weather was beautiful and warm, and the miners were generally at work upon their claims, and doing as well as formerly. Some of them were making a big thing. Mr. Bridge's claim was paying largely; a day or two before I left I offered him \$7000 cash for his claim, and he laughed at me; I think he will be able to take out of it \$50,000. The Wiser claim is still paying largely. They were not working Jack Munroe's claim when I left. McKivet & Co.'s claim on Nason's gulch, is paying largely; Chas. Wilson's claim, on one of the tributaries of Summit flat, is also paying largely, and many others I might mention. Wages are \$10 and \$12 per day, hands to work at these prices are scarce. My opinion is that not less than 2500 men were in the mines when I left.

"The mines are all they have been represented, and I think the country already prospected is capable of liberally rewarding a population of 1500 miners, and I can see no reason why a much larger portion adjacent should not be equally as rich in gold."

The Times has received, by Jones & Tracy's express, information that a man named Brown, in attempting to reach the Dalles from Salmon river, had been frozen. Mr. Woodward and others had been out and found the frozen man alive, after lying in the snow five days and six nights, without food, and 35 pounds of gold dust for a pillow. His discoverers were much startled at finding him alive, after so long a snow burial. He was brought in upon a sled made for the purpose, and was apparently getting along well till the afternoon of the 12th, when he commenced having chills. He died on Thursday morning.

The Call has also the following item, dated Portland Oregon February 20th: A word to those who think of going to the Salmon river mines, is not to start from San Francisco before the 1st of April, for it will be impossible to go by the way of the Columbia river, as the river is frozen from three to five feet thick between this place and the Dalles. It has been the severest winter known since it has been settled by the whites. Snow is two feet deep in this vicinity, and if we are compelled to remain in Portland until April, God help those who are poor. I must confess the Oregonians understand the ropes as regards prices. Board is from \$8 to 14 per week, and very poor at these figures. There are at this time some two thousand miners in this place, which is about all the city can accommodate. My object in writing

coming here, and I wish to warn them not to start too soon. My advice to all coming is to get their outfit, provisions, etc. in San Francisco, for if they do not they will have to pay very dear for them in Portland.

The Enterprise has been informed that the Gould & Curry the Spanish and the Ophir companies have struck rock worth \$50,000 per ton. Some of our friends entertain doubts of the correctness of the statement. We are creditably informed that the statement is reliable. These companies are taking out pure silver, with coupons attached for the premium. Syksey has the documents, if any one doubts after this.

Since executing the above illustration Messrs. Lockwood, Ewell & Co. have moved into their new store. The display of new garments, and fashionable goods of every description for gentlemen's wear, evince taste and judgement on the part of the gentlemen connected with this establishment, which is now eligibly situated on the corner of Merchant and Montgomery streets.

AURORA.—Mr. Smithson, who arrived here on Tuesday, states that all the quartz mills at Aurora are running night and day, and turning out a large quantity of amalgam. Several leads had proved much richer in silver than had even been anticipated, and the prospect is that they will be richer as the workmen get deeper on them. Mr. Williamson, who went to Aurora only last March, sold one half of his interests a few days since for 18,000 cash. Half a ton of the main Esmeralda rock, refined by Clayton's silver process, actually yielded a bar worth \$150. This was top rock and not supposed to be of the best. The bar was brought to Carson yesterday.—*Silver Age*.

COAL MINES.—The Sonoma Journal says: Out of evil comes good. The recent heavy rains have so saturated the earth that land slides are prevailing all over the country. One of these occurred on the Petaluma valley side of the Sonoma mountain, and has revealed to view the lead of a coal mine. Of how extensive a nature it is, is not known at present.

GOLD IN NEW ZEALAND.—The Sierra Democrat says: Some sensation was produced in town by the circulation of a letter from an old Downvillian, now in New Zealand. He wrote to his friend that rich placer and hill diggings have been found—equal to the best ever found in California, and that the advantages for working are superior. A number of adventurers purpose going.

OUT OF WORK.—We believe there are now about 3,000 miners out of work in this neighborhood. This state of things involves an immense amount of loss in daily wages, decrease of business, etc, which affects more or less every man in the community.—*Tuolumne Courier*.

PLUCKY.—During the past two weeks, says the Yreka Journal, many persons have started for the new mines, per Foot & Walker's line. With their baggage done up in a handkerchief, and slung on the end of a crooked stick, they are

H. T. GRAVES.

A. S. HALLIDIE & CO.,

WIRE SUSPENSION BRIDGE BUILDERS,

and Manufacturers of

PATENT WIRE ROPE.

WIRE Suspension Bridges of any span and capacity erected, and material furnished.

Having been constantly engaged in the erection of Wire Suspension Bridges and Aqueducts for some years past, we are fully prepared to do any work satisfactorily at a low figure, and to guarantee PERMANENCY.

Parties who are about erecting bridges will find it greatly to their advantage to give us a call before deciding to build wooden structures, as the recent floods throughout the State have proven them to be wholly unsafe and unreliable. A number of our wire suspensions are now in use in different localities throughout the State, no one of which has been in the least affected by the freshets.

WIRE ROPE, for mining and ferry purposes, manufactured of any length and size required, being cheaper and better than hemp.

Scales of weights and strength with prices, furnished on application to the manufacturers. Send for a circular.

M.I.

A. S. HALLIDIE & CO.,

412, Clay street, San Francisco.

ROYAL HOTEL.

VICTORIA, V. I.

JAMES WILCOX PROPRIETOR

THE ABOVE HOTEL is conducted on the most improved principles; is situated on Wharf street; of easy access to all new arrivals, being in the immediate neighborhood of all the wharves. The proprietor begs to inform the miners of California and traveling public, who intend to visit Victoria, that he has superior accommodations for single and married persons or families, with or without board.

Guests entertained at the following rates: Board per week six dollars; Board and Lodgings, \$8; Board per day, \$1; Lodgings 60 cents. The Bar furnished with Wines, Spirits, Malt Liquors, Cigars &c., all of the best quality.

N. B.—The Building is Fireproof.

Jan 30

SPECIAL NOTICE.

HIGHLY IMPORTANT INVENTION IN DENTISTRY.—Dr. D. STEINBERG begs leave to announce to the citizens of this city, that letters patent for his invaluable improvements in mechanical Dentistry were granted him on the 12th of November last.

This invention consists in the application of CEMENTUM to gold plates for artificial teeth, and are acknowledged to surpass all others in use, for the beauty, style and exactitude of fit; their weight compared with others, is less, and are far more durable by the addition of the gum enamel. Specimens of this valuable invention may be seen and examined at the dental office of the undersigned, No. 648 Washington street, near Kearny. Great care and attention is devoted to the perfect filling of teeth. Teeth extracted by the bending process.

STEINBERG & SIBEL.

Practical Dentists,

648 Washington st., near Kearny.

FOR SALE.

TEN DOLLAR LOTS; also 50-Yard Lots, and entire blocks of beautiful Garden land, on the line of the San Jose Railroad, at the West End Depot, Title perfect,—being held under a patent from the United States. Office No. 19, third floor of Nagle's Building, at the southwest corner Merchant and Montgomery streets.

San Francisco Jan. 27, 1862.

HARVEY S. BROWN, F.B.I.

W. BOHM'S BUCKLE INVENTION.

I desire to call the attention of the public to my late invention in the structure of

A NEW STYLE OF LADIES' BUCKLES.

for which I have applied for Letters Patent. It is by far the most beautiful ornament now in existence. In the Mining and Scientific Press a full description appeared. Messrs. Bravermann & Levy, 621 Washington street, have a complete assortment of all shapes and embellishments. Theirs is no more than the old style, and their simplicity and ease of adjustment considerably enhances their value. (Go and examine them!)

Bravermann & Levy,

621 Washington street, for W. Bohm

REMOVAL.

We beg to inform our Friends and the Public, that we have

REMOVED TO THE LARGE STORE,

No. 419 Montgomery street, Near California, (Leco Building)

Thankful for past patronage, we respectfully solicit a continuance same.

A. ROMAN & CO.,

Cariboo and Salmon River.

The Marysville *Express*, one of our most welcome exchanges, gives the following editorially.

There is no disguising the fact that there is another fever raging among the miners in this State, similar to that which took away so many three years ago to Frazer river. That the result of the present excitement will be disastrous to nine-tenths of those who go, scarcely admits of a doubt. It is but another Frazer river affair. That there is gold both at Cariboo and Salmon river is not doubted, but that it exists in large quantities and will support a large population is quite a different matter. Some time since, we published an account of the letter, furnished us by a gentleman who had spent the last Summer and Fall at the Nez Percés and Salmon river. Our readers will doubtless remember that his statement was not of the sensation order so prevalent, but he stated that the Nez Percés diggings yielded from \$2.50 to \$19 per day to the hand; that the Salmon river diggings are situated in a small basin high up in Salmon mountains; that they are exceedingly rich, but are very limited, covering an area not exceeding two miles square; that every foot of them was taken up before he left, and was occupied; that the country surrounding had been prospected for a distance of sixteen miles in the fruitless attempt to discover rich diggings. He very rationally concludes, therefore, that the Salmon diggings were but a small pocket, and that it would be folly for persons in this State to go there under the delusion that they would be able to find rich and extensive diggings open to them.

There have been some extraordinary stories told about the Cariboo country, but none more astonishing than the old Frazer river sensation stories. After this river had been prospected, and it was fully ascertained that it was one grand humbug, the general conclusion was that the marvelous stories which created the excitement and caused so many thousands to rush there, were manufactured by ship owners and other interested parties for that express purpose. Who knows that the same parties are not the authors of the extravagant Cariboo stories? Mr. A. W. Nightingill, well known to many of the people of Marysville, was among the thousands who were taken off by the Frazer river fever, but he remained after the excitement was over, and thoroughly prospected the river as far up as he could go. He informs us that he did not go into the Cariboo country, but was quite near it, and saw and conversed with persons that were familiar with it. The climate is exceedingly cold and severe, there being not to exceed three months in the year sufficiently mild to admit of laboring in the mines. There is great difficulty in transporting provisions to that locality, and hence they are and must continue to be very dear. He thinks it will be necessary to make \$50 or \$60 per day in order to save any money, and the season is so short that even at that rate the entire Summer's profit would be consumed to support one's self during the winter. Under the circumstances, how remarkable it is that Californians, who have an excellent climate and good paying mines, will go off on a wild goose chase after an imaginary fortune away up almost amid eternal snow, and in the most severe and trying climate. Frazer river, Gold Lake and other humbings should prove a wholesome warning to the people of this State. They have certainly had experience in the school of adversity to have learned lessons of wisdom. Strange it is that they will again be carried away by a fictitious excitement, which must result in disappointment and empty pockets.

Australia.

From the Melbourne Herald and Leader, of Nov. 22nd, we collate the following items of news.

The principal intelligence relates to the wonderful gold discoveries in the Lachlan district, and the details of the ill-fated Burke exploring party. King, the survivor of this expedition, was the recipient of a grand ovation at Sandhurst and Castlemaine, on his way to Melbourne. His return was everywhere hailed with enthusiasm. At Melbourne, Sir William Doulton lent his own carriage to convey King and his party home. The adventures and fate of Burke and his companions have been commemorated in a volume, entitled, "Burke and his companions." The Victorian Exploring Expedition; from its origin to the return from Carpentaria, and the death of Burke, Wills and Gray, from starvation; with Burke's and Wills' journals, King's narrative, Howitt's diary, etc., etc. Price one shilling; or bound in cloth, one shilling and sixpence.

The total quantity of gold brought down by escort from the several gold fields during the present year up to date amounts to 1,657,895 ounces, to the value of £6,831,580 against 1,823,326 ounces, to the value of £7,293,304 brought down during the corresponding period of last year. The shipments during the current year have been 1,752,033 ounces, worth, at £4 an ounce, £7,008,132. During the corresponding period of last year, the quantity shipped was 1,914,341 ounces, to the value of £7,657,864.

Letters received from Lachlan's diggings state that the ground opened up there has thoroughly satisfied the most brilliant expectations of the seekers after the precious metal, and that the field is likely to turn out to be the richest in all Australia. These diggings are in the Western District, about 80 miles from Lambing Flat, 48 from Condolin,

46 from Canowindra, 75 from Orange, and 70 from Cowra. The shares in some of the claims are valued at \$2,000. One hole, four feet by two, yielded 31 oz., another claim 80 by 80, will wash five or six ounces to the tub of four buckets. About twenty holes equally rich have been bottomed. Rich patches occur frequently. The place has a lively appearance, as the diggers hoist a gay flag when they have made a good pile. A rush has set in, and diggers are arriving in thousands. By Christmas, there will be it is calculated, not less than 20,000 people on the spot.

Items about the New Mines.

The Portland *Advertiser* gives the following: The winter in Oregon may be considered as at an end. We have a prospect of continued fine weather, and look forward to the speedy opening of the Columbia river. There are hundreds of miners in this town awaiting such an event. Even many of them unable to await the opening of the river, have dared the ice and snows between here and the new El Dorado. With a knowledge of the country, for one we must protest against such expeditions at this season. Already we have many instances of the fruit of such folly. Men, too, acquainted with the country, the seasons and mountain life, are sufferers by too rash a daring.

We predict that the Columbia river will be open in two or three weeks. The snows between the Dalles and the mines will have melted away, or at least so reduced that animals may get along without perishing from hunger, for it is a fixed fact that no feed can be obtained on the route between the Dalles and Walla Walla, or between the Dalles and Grand Ronde Valley. Again the steamers will be in operation in the course of two or three weeks, and parties can travel on them to within seventy-five miles of the Salmon river mines. The river route will be far more preferable, safer and cheaper to travel than any other route until late in spring.

There are many reasons going to prove this. To go by land to the mines at this present moment, we conceive to be almost impossible, and if barely possible the miner would be losing both time and money, besides the risk and danger to be incurred in such an experiment. Suppose he gets to the Dalles in safety, say 150 miles over solid ice, or it may be snow from two to five feet deep, there he will be compelled to remain at an expense of from \$12 to \$14 per week; or should he be rash enough to attempt it overland, he must buy a horse at the Dalles, that will cost \$40 or \$50, a wretched beast at that. Now we affirm that a horse cannot, at present, travel between the Dalles and Walla Walla. Are you going to tramp over snow, say two feet deep, a distance of 181 miles, to Walla Walla? Then you will have 150 miles more to travel, the greater part of which is, at this moment, covered with snow. These are questions that miners may answer for themselves. We are merely pointing out the difficulties of attempting impossibilities. True, we have many men brought here with the expectation of going right ahead to the mines. Our only apology to such, is this. That the season has dealt with us with unusual severity, and a matter over which we had no control. We firmly believe, however, that two weeks of such weather will clear the river of the ice, and render navigation easy. In view of all this, miners should make a merit of necessity, and try to get along as well as possible for a couple of weeks. To use a trite saying, a man may go farther and fare worse than at Portland.

The *Call* gives the following warning to all Cariboo-hoos. "Mr. Robert L. Harris, a civil engineer of this city, who returned from British Columbia on the Cortes yesterday, informs us that there is already much suffering among the Cariboo adventurers who left San Francisco about a month since. Those who have prematurely attempted to penetrate the interior wilderness, in order to reach the goal of their hopes, have suffered severely from the inclemency of the weather. Scarcely provided with the necessities of life and huddled in on all sides by the inhospitable snows of that Northern region, they must now heartily regret the foolhardy step they have taken. Those who are determined to leave the substance of California to chase the shadow of Cariboo, would do well to listen to the warnings of experience. Until the middle of July the hyperborean winters of that sterile region are marked by a severity which can only be withstood by those who have made the necessary preparations of shelter and provisions. About that time the weather becomes milder, the summer, sets in, and lasts till about the beginning of November. During these few months, prospecting and mining may be engaged in. But what folly to start for Cariboo before the first of June, at the earliest! Those who attempt it, in the face of the light before them, will suffer an awful penalty for their rashness.

MARIPOSA COUNTY.—The *Gazette* says the recent floods afford facilities for mining in that section, in places where no pick has been struck, or shovel stuck, since the winter of '52 and '53. On Sherlock's Creek, mining has not been so prosperous for years as at this time. New claims have also been opened on Mariposa Creek, one a few miles above the town of Mariposa has been paying recently as high as from eight to twelve ounces to three hands employed.

GOOD RUN.—The Bunker Hill quartz mill on Deer Creek, cleaned up on Saturday, 344 ounces of gold, worth \$17 per ounce, the proceeds of a run of 18 days.—*Nevada Transcript*.

Army Telegraph.

In July last the French Minister of War caused some experiments to be made in Champ de Mars with army telegraph. Let us see in what these experiments consisted: A certain number of mounted artillerymen were followed by a vehicle properly attached, in which were placed lances designed to serve as telegraph posts, and also as electric conducting wire. At a given signal they quickly extended themselves over the line; this signal was given as soon as the extremity of the conductor was fixed to the earth by the means of a stake. At the distance of thirty metres a horseman dismounted, took a lance given him by an artilleryman in the carriage, and set the lance in the earth, causing it to make half a turn so that the head of the lance should be encircled with the electric wire. The horseman then made the lance fast by the means of two guys fixed to it, and fastened to the earth with two stakes. The same operation was performed rapidly by other horsemen, but it was found that the lances were required more than once in one hundred metres. These experiments demonstrated that a telegraphic line may be improvised, in case of necessity, for armies in the field for example, and that too in the time strictly necessary for men and horses to move from point of departure to the point of destination. In case of obstacles to the carriages, resulting from irregularities of the ground, each horseman charged with the duty of planting the lance, carries it in his hand and at the stirrup as practiced in the regiments of lancers.

FROM HUMBOLDT.—A correspondent of the Enterprise, writing from Humboldt City, Jan. 31st, says: Our country organization is completed, and stand thus:—Sheriff, Robert Melbeth, of Santa Clara; County Clerk, W. J. Whitney, of Humboldt; Recorder, Wm. Brayton, of Star Canon, Treasurer, A. W. Nightingill, of Buena Vista; Collector, J. W. Towle, of Prince Royal; Assessor, S. M. Rebert, of Star Canon; Commissioners, J. W. Briggs, of Buena Vista, L. M. Carter, of Humboldt, and M. S. Tompson, of Prince Royal. These were the regular candidates nominated in convention, at Star Canon, on the 28th of December last.

Our mines are being fully prospected, and before the first of April there will be, in the Humboldt Mining District, fourteen of the best ledges prospected, either by tunnel or shaft; and the ore ready for crushing. The Cuba has near 300 tons ready to crush, and the rock is very rich. The company has been offered four thousand dollars per month to rent for six months. This, considering that the rock would have to be hauled to Chinatown for crushing, is a fair offer; but it has been refused by the company. The San Bernard shows immensely rich in gold; also the Crittenden. In short, our prospects are brilliant—all we require is capital.

The Silver Age is informed that the Buffalo Gold and Silver Mining company, consisting of a few gentlemen of this place and Virginia, is about to commence running a tunnel in the Sholes lode, situated in Sigel district, thirty miles from Virginia. This district, says our informant, bids fair to be equal to Gold Hill. The Sigel company had a shaft down some sixteen feet about a month ago, and was then saving the rock to crush. The Hawk eye company had at the same time a shaft down some seven or eight feet, with the very best of prospects. The Sigel company had some of its rock, obtained at a depth of ten feet, assayed, which yielded \$870 per ton. For smart young men we think this is about as good a chance as is offered in the Northern mines, and it's a little nearer home.

SISKIYOU.—The prospects of a rich harvest in the mines of this county are exceedingly flattering. The *Journal* says new placers will be delved as soon as the weather is free from frost, and the snow melts to furnish water. It is thought that large quantities of gold will be taken out during the summer, and much by Chinamen who will work claims deserted by those who have caught the Salmon river fever. The late frost, has sluiced down the bed of Scott river, and made it as low as in 1850, before mining was commenced. Miners are working in several new spots with rockers, and making from \$250, to \$50 per day.

RIVER MINING.—All along the Trinity River where the water has fallen sufficient to uncover the bars, John Chinaman is busy with his 'locker.' The late floods having swept away much of the rubbish, and in many instances leaving entire bars bare to the bed rock. John has a good time creviceing, and we are told they are making from \$6 to \$20 a day, in many localities. When the river falls to its usual mining stage we predict that more gold will be taken out in the succeeding three months than has been during any similar length of time within the last five years.—*Trinity Journal*.

A NEW MILL.—The Placerville *Republican* says, that some time since specimens of quartz were procured from the Truckee Mining District and taken to London by English capitalists, for the purpose of being assayed, which has proved so satisfactory that orders have been sent for the speedy opening of tunnels, and funds sent for the construction of a mill on the Truckee river, about a mile and a half above Stone's Crossing. The mill will be one of superior construction, and will run about twenty-four stamps.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....MARCH 15, 1862.

The MINING AND SCIENTIFIC PRESS published is at 522 Merchant bet. Montgomery and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—Executed with dispatch at the cheapest rates.

Patrons will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

Business Attache.

W. WATSON, Esq., formerly of Syracuse, N. T., has this day assumed the distribution of the PRESS in this city, as well as the solicitation of advertisements, job work, engravings, collections and the general business management of this publication. All matters transacted by him for this office, in these branches, have the entire sanction of the proprietor of this journal.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. Having the best legal talent near the Patent Office in Washington City as our associate, we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

THE MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

REMOVAL OF THE "PRESS" AND PATENT AGENCY.

The business of this office having become quite extensive, it therefore made it incumbent upon us to remove from our offices in the Government House, where we had scarcely room enough to do our regular office business. We occupied said premises for nearly two years, and were really loth to leave them. Circumstances have placed us so that we now can enjoy separate offices for the printing of our MINING AND SCIENTIFIC PRESS; and the applicants for letters patent need no longer be interrupted by the thousand and one inquiries heretofore made, while we occupied said offices.

We have moved our printing rooms to Merchant street, No. 522, between Sansome and Montgomery up stairs, and the

PACIFIC PATENT AGENCY

and the Editorial rooms are now eligibly situated in the former U. S. Court Building, northeast corner of Battery and Washington streets, in room 24. All persons having business with us will favor us with a visit as early as convenient. Letters will be addressed to us in accordance with the above.

Our Eastern Boundary.

[The mismanagement, neglect, imbecility and peculation, that has thus far attended the business of ascertaining and settling that portion of our eastern boundary line between Oregon and New Mexico, constitutes another item in the legacy of shame wherewith California has been so richly endowed.

More than twelve years have passed since the convention that framed the Constitution of this State designating its eastern limit, was in session at Monterey; yet, during all this time the work of its definite location has remained undone, and the question of its whereabouts been left an open one. Not, that by any means its settlement was a matter of no practical moment, or that the State Legislature and the General Government was indifferent, and failed to make any appropriation for its adjustment. Liberal provision was made by both for fitting out surveying parties, and commissioners appointed from time to time to carry on the work. How, between incompetency, indolence and political chicanery, the business has been procrastinated, at the same time that the money appropriated for its accomplishment has been spent,—how parties representing the State were in the field and ready for operations, when those acting on behalf of the General Government were absent, and *vice versa*,—how when a man of science, versed in astronomy and surveying should have been selected for approving and

certifying to the correctness of the work, a mere office seeker, ignorant of both, was appointed: and final, how the whole thing has been turned into a grand burlesque—the money squandered—the labor lost, with scarce any actual progress made, are matters too notorious for concealment, and too little to the credit of all concerned to be recounted in detail.

But we notice a new scheme is on foot, which, if it do not secure the speedy settlement of this vexed question, may, at least, serve to keep it open for the benefit of political beggars, and add to its present complications. Congress, at its last session, erected from that portion of Utah lying next to California on the east, the New Territory of Nevada, making its western boundary the dividing ridge, separating the waters that flow into the Great Basin from those flowing into the Pacific, *provided*, the people of California would consent to cede that portion of their territory which might fall within those limits, and which embraces a strip of country from ten to twenty miles wide, and about three hundred and fifty miles long. For the purpose of inducing our Legislature, now in session, to take favorable action in the premises, the governor and Legislative Assembly of Nevada Territory appointed a Commissioner to bring the subject before that body, and represent to them the reasons why they should consent to cede to them the territory in question, as suggested by Congress in the Organic act.

Leaving out of sight the question whether our Legislature possesses the power to cede away the territory of the State, or to alter its boundaries as fixed by the Constitution, it strikes us as a very dubious policy for them to do so. The reasons urging this action, as set forth by the Commissioners of Nevada in a well written and able memorial addressed to the Legislature, are, that the tract of country sought by them, is for the most part of a mountainous and barren character—the habitable portions consisting of a few small valleys, lying to the east of the Sierra, far removed from the settled parts of California, having a mean distance of three hundred miles from its capital—that communication with this side is at all times difficult and expensive, and nearly impracticable in the winter, the highest part of the Sierra Nevada, passable only through a few widely separated gaps, lying between,—that the capacity of this region for supporting a population is very small, as it is poor in agricultural and mineral resources,—that its exports, of which hny and lumber are the staples, find a market in the Territory of Nevada, where also the inhabitants make their purchases, and transact most of their business, being there largely interested in mining and other pursuits,—that the average distance of this territory is not over one hundred miles from the capital of Nevada, to which the inhabitants have easy access by means of good roads, at all seasons of the year, wherefore, their convenience would be consulted and their interests advanced by a political union with a people to whom they are already so closely allied through geographical proximity, constant intercourse and business relations.

They further set forth, that whatever of mineral pursuits may be carried on in this region, will be chiefly silver mining, a branch of business nearly foreign to California, but largely engaged in by the people of Nevada, and one that requires a peculiar policy for its care and development,—that the population within the limits of this State, east of the Sierra, is insufficient for the formation of separate counties on that side, wherefore they must be attached to those having their seats of justice west of the mountains, subjecting them to serious inconveniences, and nearly defeating, as has always been the case, both the ends of justice, and the collection of revenue,—that with the present boundary, small communities are divided, one portion being in California, and forced to go over a hundred miles to their County Seat, while the other is in Nevada, which has organized counties, with proper officers, along the whole length of this district, the lines of which have been so shaped that they could at once be extended over it upon its session to that territory, without delay or further Legislative actions.

The memorial further recites, that a large majority of the people living on this tract are in favor of being incorporated with Nevada, not only as a matter of convenience but of safety, since the State of California, although claiming jurisdiction and attempting to assert her authority there for many years, has totally failed to protect the citizen or punish crime, no civil or criminal process ever having been served, except in a few instances, and not a single case of crime ever having been punished. This inefficient administration

of law it is asserted, has rendered this district an asylum for the guilty, and made it a border ground for outlaws and ruffians—a condition of things that will be likely to continue if it remain a part of California; whereas, if joined to Nevada, the officers of justice being at hand, and well acquainted with the people and country, would be able to execute the laws with much greater certainty and economy. As a final argument, the Legislature is reminded that many members of the convention which framed the constitution of this State, were in favor of adopting the summit of the mountains as a boundary, and that by transferring the few thousand people who inhabited this belt to Nevada, they will be nurturing the elements for a new State on the Pacific thus hastening the time when nearly one-third shall be added to the Congressional delegation from this side the continent, an event in which the people of California are equally interested with those of Nevada.

This document, which, as we have said, is well drawn, certainly makes no mean argument in favor of the proposed change of boundary; yet we cannot see that the Legislature even if favorably disposed toward this measure, has more than the simple power to adopt the preliminary step of submitting this like any other question involving a change of our fundamental law to the people; whether they should even go so far as this, is in our judgement a matter of grave doubt.

What is California to gain by ceding away so large a portion of her territory—covering we should suppose an area of five or six thousand square miles? It is said to contain little or no mineral wealth. But here is room for mistake, as most of the Mono country believed equal to Washoe in richness, is clearly within this State, and no one can tell what further discoveries may yet be made in this belt, portions of which are so highly auriferous. Nor would the contemplated change tend to settle the boundary line, or place it in a condition any more satisfactory than the present, since the attempt to follow the devious course about the headwaters of these mountain streams would be infinitely worse than the existing straight line. Had the main summit of the Sierra been proposed it would have been, not only a more natural and convenient, but also a more easily ascertained and recognizable boundary; wherefore while we wholly deny the authority of the Legislature to grant the relief desired by our Nevada neighbors, we much question the expediency of the people themselves ever doing so.

Utter Necessity of Mining Instruction.

How long California may have to labor yet under serious disadvantages and political abuse, we are at this moment unable to solve, suffice it to say that up to the present period we have suffered from a special want, and that may be summed up in the following:

Mining has been and is now being carried on in the most primitive manner; but that we have a wide range and diversity of mining enterprises, we may assert that for placer mining the sluice and rocker may answer the purpose well; we will therefore leave such implements to the Coolie to grope along to his heart's content. But delving into mountains in search of metalliferous quartz veins, requires not only a knowledge of geology and mineralogy, but mathematics and engineering of the highest order, and in this particular we are most wonderfully deficient.

Can it be questioned that we have not the metallic wealth in these States to warrant our Legislature to provide for the dissemination of such knowledge? In former editions of this journal we have often remarked, that the poorest gold quartz lead in California would pay better than the richest silver mine in Nevada Territory. The immense failures in mining enterprises are mainly attributable to the want of proper knowledge in mining pursuits. Millions of dollars have been lost in such operations, because the miners here cannot follow up a paying lead, or to be able to distinguish a real lead from a mere fissure or branch vein. The rising population require to be taught, and the immediate necessity for such a school should at once be agitated and money appropriated therefore.

Although a State Geological Board graces California, at an expense of \$6,000 a year, with additional appropriations of probably \$20,000 more for the same purpose, which is indeed commendable for California, yet have we to learn the first new thing pertaining to this State, save the collection of minerals, maps, and preliminary steps taken to survey our State, which may be of great utility hereafter, and the same

have been in office one year! The lecture recently prepared for both Houses of our Legislature was entirely devoid, except perhaps in one allusion.

We must have practical and scientific knowledge imparted. The miner and every citizen on this coast should be made acquainted with what the earth contains, especially that part on the Pacific coast.

Patents.—Benefits therefrom.

At no period in the history of the present era has there been a greater amount of business transacted, or a greater necessity felt for inventions than now. The facilities for obtaining patents have been materially simplified, and the expenses are considerably less than heretofore, so much so, that the application for a patent cost then \$150, which can now be obtained complete through this office for seventy-five dollars. Inventors and discoverers can superintend the preparation of their papers here without entrusting it to agents in the Atlantic, whose interests are more closely blended with their patrons, friends and inventors there, then to allow a patent to issue to one far north or west.

The MINING AND SCIENTIFIC PRESS has ever advocated the cause of home industry and the best interest of our mechanics, citizens and laborers. It would therefore be the medium for disseminating new inventions or discoveries. Thus far Californians have produced more novel machines, applicable to our wants and requirements, in proportion to the inventors of the Atlantic States. We are willing at all times to advise inventors as to the mode of bringing their inventions before the public, and take steps for securing patents thereon.

We have just begun a new volume, and by way of encouragement would it not be well for our mechanics to lend us a helping hand, that is, with the amount of twelve and a half cents per week for the PRESS? We are satisfied that they will receive more than an equivalent in useful and practical information—giving, as we do, every new discovery and invention indigenous to the Pacific States, besides advocating the cause of their trades and professions. Our carrier will in due time leave you a copy, which we trust will be as acceptable as your shillings will enable us to enlighten you.

Regular Correspondence.

CARSON CITY, N. T., March 7, 1862.

ED. MINING AND SCIENTIFIC PRESS.—The winter here has been long and severe, nor do we yet seem to have done with it. As the condition of the roads, the running of the mills, and almost every other kind of business depends upon the weather, it naturally becomes to us a subject of interest. The high waters, however, have gone down, and although we continue to have enough of rain to keep the roads muddy, we do not apprehend any more trouble from the flood this season, nor is there much reason to believe that we will again suffer seriously from that cause for many years. From all that can be gathered from the Indians, there has never before, within their recollection, been such an inundation; and the water marks and other signs clearly indicate that none has happened within the last half century or more. There would therefore seem but little cause for alarm hereafter, and very slight necessity for the expensive precautions some of our citizens seem disposed to take against future damage by high water.

Among other projects designed to guard against losses of this kind, is a grand scheme for taking the water of Carson river from its present channel, at a point two and a half miles above Dayton, and conducting it through a large flume, to be carried along a high bank that runs parallel with the river, and at a quarter of a mile west from it. By this means a fall could be obtained of from fifty to a hundred feet along the entire line, creating an immense water power, and increasing the capacity of the stream as now used for propulsion of machinery about one-third. By this plan all exposure to damage from high water would be forever guarded against; nor would the mills be subjected to any interruptions from that cause.

The late destruction of property along this part of the river was terrible, and if these inundations were likely to occur often, the proposed plan would be a good one. It may be as it is, in view of the large increase of power that would be secured by it. There is likely to be a difficulty in the way of carrying it out, however, there being a prior claim to

the entire water of the river, dating back as early as the summer of '59, and the owners of which have not yet been consulted as to its proposed diversion. It is the curse of much valuable property here that the title is in dispute—this being a case in point.

Even as early as the period mentioned, certain parties settled at Chinatown (now Dayton), and forcing the advantages of that point for milling purposes, took up the water and located a track of land along the river, a little below the town. This tract was secured by possession and subsequent improvement, and by full compliance with the requirements of the laws then existing, and governing the manner of locating and possessing this species of property. Subsequently others intruded upon this tract, one party laying out a town, another building a cabin, while a third commenced digging a ditch with a view to appropriating a portion of the river; and so, little by little, these trespassers kept encroaching upon the property, until by dint of violence, robbery and impudent assertion of rights, they fairly overran the whole of it, and in the absence of any legal authority here, have thus far managed to keep a foothold upon their ill-gotten possessions. But the reign of ruffianism and brute law is over in Nevada. We have now courts, and officers and laws, and there is little doubt but the pioneer settler, after years of outrage and wrong, will be restored his property and his rights.

The enterprise alluded to, if undertaken and suffered to go on, will involve an expenditure of nearly \$200,000, a sum that could, no doubt, readily be commanded for the purpose were the title to the property not clouded by conflicting claims. This work is but one of many others, equally gigantic now being projected here, and the execution of which promises to render the coming season one of unusual activity in this territory.

Among the leading works of this kind is a railroad from Virginia City to Washoe Valley, a distance of sixteen and a half miles. This road, it is estimated, will cost \$650,000, besides the rolling stock—perhaps a million, all told. It is in the hands of substantial business men and capitalists, who worked hard to get a charter from this Legislature, showing what value they set upon the franchise. All the preliminary steps, such as survey of route, purchasing right of way, contracting for material, &c., have been taken, and some little work done, giving assurance that the project is a *bona fide* one, and will not fail to be executed in due season. Other railroad charters were obtained from the Legislature, one for a road from Virginia City to the Truckee River, via Gold Hill, Silver City, Dayton, Carson City and Washoe Valley. The portion between Virginia and Dayton—seven miles—will be built within the next year. A charter was also granted to a company for a railroad from Aurora, Mono County, to Walker River, a distance of twenty-two miles; but what they are doing or likely to do, I am unable to say. The franchise is a very valuable and one ought to command means for the early construction of the road.

In the matter of ditches, roads, bridges, mills, &c., there is no end to the building that will be undertaken this season. Many of our towns will also be greatly enlarged—this of Carson, it is believed, fully fifty per cent. in the course of another twelve months. In Washoe valley alone I can hear of over twenty quartz mills to be put up, some of large capacity, costing fifty or sixty thousand dollars. At Galena, Dayton, on the Carson and Truckee rivers, and in fact everywhere that water power for driving a stamp can be had, some sort of a mill will be erected—a good many steam mills, now that we are likely to have ample supplies of coal, also being in contemplation.

It has been the boast of those interested in the Washoe mines, that their product would in a few years exceed that of California. These few years were generally supposed to mean a generation or a half century; but I can assure you they may be accepted to mean no more than a very short period—as three or four years at most—with good luck, no more than two or three. I believe we shall within that time be able to export a million of dollars in bullion per week. In the event of our getting a mint as we should, and I believe we will have, we will send the dollars themselves.

A fire broke out in the roof of the Ophir Works, in Washoe Valley, a few days ago, that threatened the destruction of the entire establishment, as would have been the case, but for the precaution that had been taken, of keeping a large reservoir of water on top of the building, with all parts of

which it was connected by means of hose. Owing to this, and the presence of so large a company of their own workmen—nearly a hundred—the mill escaped with only a serious damage to the roof. It is wonderful the exemption we have enjoyed from fire on this side the mountains, considering we have the same dry climate and high winds of California, and have been compelled to build both our towns and mills of the most combustible materials; as yet we have had no fire of any magnitude, and are now getting so many fire-proof buildings in all our towns, that, with a tolerable fire department, we stand in no great fear of a general conflagration.

Since the inauguration of our Territorial government, and the adoption of a full code of laws, we have experienced much greater degree of order and quiet than before, and really begin, with our officers, courts, schools, churches, &c., to feel as if we were living in a partially civilized community. We are generally counting on a lively summer here, notwithstanding our late disasters. The mines are likely to yield enormously, far exceeding the expectations of the most hopeful; now that we are getting a considerable number of mills, with a very good chance of cheap fuel in the new coal mines, you may set it down that there is a long season of prosperity in reserve for Washoe, and that it will heat California in the production of precious metals even sooner than the most sanguine had supposed.

From Mono and the Humboldt we get the most cheering accounts, the former beginning already to contribute some little to our staple export, an amount that will soon be largely increased by the starting of additional mills. But we need not go out of the Washoe region to find such store of mineral wealth, as the world never before saw or even dreamed of, except in works of fiction. The Comstock lead, including Gold Hill, and the grounds of the Daney company, exceeds by far anything of which history gives account.

Of the actual wealth of those mines but little is known, they having been worked and managed in many instances more with a view to conceal and depress than to enhance their real value. This has been part of the scheme of sharp men, who have gotten a hold of interests in them, and who are seeking to lower them in the estimation of the other owners, with a view to buying them out at reduced rates. It forms a part of the regular mode of operating on the part of these sharpers, and is just now being practiced, or attempted on a number of claims here. As is well known here, one of the most valuable mines in this Territory is that of the Daney company. It is generally considered more desirable property than the best claims at Gold Hill, consequently these shrewd dealers have for a long time had their eyes upon it; but the owners, though at first poor men, having done their own work, and being out of debt, have not been compelled to sell, and being better informed as to its richness than anybody else, persistently refused to part with a foot of their ground. This has put our speculating capitalists to their wits' ends, to devise some mode to depreciate the claim, by suggesting objections to it or affecting to undervalue it, but all to no purpose; and we now find that in their eagerness to get hold of this ground they have, by a sort of silent underbidding, run it up to five or six hundred dollars per foot, and yet have been able to get very little at that. It will no doubt be worth a thousand dollars a foot in ninety days.

The weather here is fine at present, and we are getting to work again, the roads being once more passable, and many of the mills resuming operations. With security to person and property, and political quiet, we feel that we have a glorious and prosperous future before us, and that Nevada will make rapid strides in population and improvement. Our governor is just now off to California, where he goes as one of the commissioners for procuring a cession of territory from your State, with a view to bettering our western boundary. There are many good reasons why California should deal graciously with us in this premises, as we anticipate she will do.

Mrs. Day's Hesperian.

A neat and most useful monthly pamphlet, of light reading matter, with fashion plates, etc., is out for March. Mrs. Day deserves to succeed, as she is indefatigable and enterprising. The selections are not only good but evince judgment and taste.

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends they wish disinterred, are informed that they have the most complete registry in existence of graves in that cemetery, having added in my own record by purchase, the books of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology: (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled "The Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of a convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Method of mining and Metallurgy; 3d. Metallurgy; 4th. Chemistry and geology; 4th. Improved System of Assaying; 5th. The geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

A BOOK FOR THE MINER.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide"; a compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work. It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character: and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work, "The Miner's Companion and Guide," and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINER.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compendium of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's tangled web its hidden treasures.—[Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1867, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual loss was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300—1000ths. fine.....3cts per oz.
" from 300—1000ths. to 750—1000ths fine.....7cts " "
" " 750—1000ths to 950—1000ths ".....14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16—4—11ths. cents. per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARs SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16—4—11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16—4—11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to before extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Shoes and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Milling Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at McCall's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Our Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Saws; Millstones; Wind Mills; of Hunt's, Johnson's and Linn's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GOLDALD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This Mill will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson, }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by these farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be jacked up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
99. We invite Farmers wishing a machine to call and see before purchasing.

Second street, corner of Folsom, SAN FRANCISCO, CAL.

Helscher, Wieland & Co. Proprietors.

Thankful for past patronage to a discriminating public, we beg leave to apprise at the same moment our many friends and patrons that the above well known Brewery has been permanently located in our new premises, on Second street—the former residence of Capt. Folsom, where we shall endeavor to continue in furnishing our numerous patrons with the best article of "Beer." We shall strive to perpetuate the good reputation for promptitude and the faithful execution of orders as heretofore, and thereby increase our custom. Nov9.

DEVOE & CO.

MINING AND SCIENTIFIC PRESS,

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 23 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This Journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates,

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Five Copies for Twelve Months, \$30.

Ten Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80

Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Lock Box 537, P. O.

Room 24, (formerly) U. S. Court Building, Corner of Washington streets, San Francisco.

Sierra County.

We are indebted to Mr. C. W. Gilbert, of Downieville, for a brief visit. This gentleman has been for a number of years residing in the above county. He gives us the assurance that mining prospects are looking up in his district—quartz mining forming the leading feature in that branch. We learned from him some interesting incidents and facts of the recent floods. He asserts that yields of placer mining will vie with those of '49, because the refuse tailings and boulders have been swept into the Sacramento and San Joaquin valleys. To prove this he says, that immense large rocks and boulders, formerly serving as monoliths or land marks, have all vanished from sight, and at times the roaring and thundering noise, with a trembling or shaking motion, were evidences that these large and massy rocks were being hurled through the streams with fearful velocity. Land slides were innumerable—one of which threatened the annihilation of Downieville. The side of a hill near by is split, but through some divine or unaccountable cause its destructive course was stayed, and the good citizens of Downieville breathed freer.

Mr. Gilbert says that the roads between Grass Valley and Downieville, will soon be in a passable condition, although the floods seriously damaged and has torn up many fine roads, which have cost the State and private enterprises millions of dollars.

Map of Esmeralda Mines.

There is now to seen at the office of Wakelee & Charles, Real Estate and Mining Agents, Merchant street above Montgomery, a well executed manuscript map of the Esmeralda Mining District, whereon the relative position and direction of most of the better class of ledges, with a plat of the town of Aurora, and topography of the adjacent country, are laid down with great accuracy. The drawing is by Mr. Brady, being drafted from surveys made by Clayton and McBride, civil engineers. These gentlemen all enjoy a good reputation in their several callings, and having resided in Esmeralda since its earliest discovery, and become familiar with all its features, the work may be presumed entirely correct, and cannot fail to be of service to those owning or seeking interests in those mines. We learn from Messrs. Wakelee & Charles, that it is their purpose to fit up rooms at their present place, for the accommodation of those dealing in Esmeralda and Mono Stocks, or seeking information in regard to them, as well as a sort of headquarters, or place of general resort for miners.

The Pacific Medical University.

Thursday evening we attended the commencement of the new session of this establishment. Tucker's Hall was filled to excess by an appreciative audience, to see five intelligent candidates ushered into the world with the delightful appendage of M. D. Music, interspersed with the evening's exercises, formed a part of the entertainment. Allusions to public matters of grave importance, occupied part of the speakers' discourse, which created some little derision.

The Pacific Medical University, is now a fixed matter on this coast; its success is beyond a shadow of doubt.

Pacific Expositor.

This monthly periodical came as usual with its quantum of interesting reading matter. It is by far the most popular theological work on this coast, being conducted with judgement, grace, and rare literary capability.

A Card from Lafayette Maynard.

EDITOR BULLETIN.—A friend,—a member of the Legislature; advises me that the statement that "L. Maynard, President of the Tax-Payers' Union, owes two years taxes on his immense estate, etc." should be corrected over my own signature, as it is being used to the prejudice of myself and the Association of which I am a member.

I beg to say, then, that my taxes are all paid. I am not delinquent to the amount of a dollar. I have never been delinquent, except in one single instance, in 1856-7; which delinquency was subsequently paid to the new Tax Collector, Mr. Patch, October 20th, 1857; the proofs of which I have fortunately preserved. L. MAYNARD.

Rich placer diggings are now being worked very successfully in Gold Canon, below Silver City, Nevada Territory. Several companies are at work, and the result of their labors has been very satisfactory.

Shipments of Gold from a New Mine.

On the 6th inst. seventy-three pounds of gold bullion, being the product of the celebrated Daney lead, situated in Nevada Territory, arrived in this city. At that time it was announced by the Daily Press that a still larger shipment was on the way and would be here soon; this, as we learn, has also come to hand, indicating that the ledge of this company, now being worked at the rate of six or eight tons per day, must be yielding largely. As yet the public has heard but little of these grounds, and from their evident richness we are led to think the surmise of our Washoe correspondent well founded; and that there may really be a purpose on the part of those desirous of buying into them, to ignore their value, with a view to depreciating it in the market. Notwithstanding these attempts, if, truly, they have been made, interests in this claim have been steadily advancing in price from the day it was opened—going up from five dollars a foot, at which it could have been bought eighteen months ago, to five hundred dollars, which it now readily commands, with little or none for sale at that, as we learn from the dealers in Washoe stocks.

We present our readers this week with a beautiful illustration of Messrs. J. & C. Schreiber's Pulu and Bedding Depot, which is eligibly situated on Sansome street (No. 406). The entire upper stories of this building are devoted to the manufacture of bedding of every description, and articles pertaining thereto, the lower or ground floor to the sale thereof.

The immense popularity of the Pulu imported by this firm is well deserved; not only does it free the couch of all troublesome insects, but imparts a warmth to the body not to be excelled by the finest feathers, while its elasticity is greater and cost materially less. Messrs. Schreiber have secured the sole right of importing this valuable article, therefore it is only to be had at their establishment. The popularity of this pioneer house is, we feel, well deserved, and we cheerfully recommend them to our many friends, feeling certain they will be well dealt with.

THE THIRTEENTH ANNIVERSARY BALL,

OF THE

FIRST HEBREW BENEVOLENT SOCIETY.

Will be given at

PLATT'S MUSIC HALL,

ON

TUESDAY EVENING.....MARCH 18th.

REMOVAL OF THE DEAD

From Yerba Buena Cemetery.

AS THE DEAD IN YERBA BUENA CEMETERY WILL BE REMOVED IN a short time by the authorities, those having relatives or friends they wish disinterred, are informed that I have the most complete registry in existence of graves in that Cemetery, having added to my own records, by purchase, the books of the late City Sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges.

Everything requisite for Funerals supplied at the shortest notice.

NATHANIEL GRAY,

General Undertaker, 641 Sacramento street, corner of Webb,
Between Kearny and Montgomery. m8 tf

WHILE YOU HAVE THE MONEY,

MAKE SURE OF A HOME!

NEVER HAZARD THE LAST DOLLAR!

To Cariboo and Salmon River Miners, and all others who wish to purchase LOTS in San Francisco with a PERFECT TITLE:

The undersigned will sell Building Lots for from \$10 to \$200. Also, 50 vara Lots and entire Blocks of the most beautiful gardening lands in the city and county of San Francisco, on the line of and at the WEST-END DEPOT OF THE SAN FRANCISCO AND SAN JOSE RAILROAD. Persons desiring to invest a few dollars, or hundreds, or thousands of dollars, would do well to call on the undersigned, as he deals ONLY IN LANDS with a PERFECT TITLE, to wit: those held under

A PATENT OF THE UNITED STATES!

Persons residing in the interior, or who are about to go to the Cariboo or Salmon River Mines, can purchase this property and leave it without any fear of adverse claims or titles springing up in their absence.

The undersigned will, if desired, give his personal attention to the assessing, paying of taxes, etc., on all lots purchased from him, and will forward to each non-resident purchaser his tax receipts, free of all cost save the actual amount of the taxes.

Office—No. 19 third floor of Naglee's Building, (south-west corner of Merchant and Montgomery streets.) m8 tf

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. V.

SAN FRANCISCO, TUESDAY, MARCH 25, 1862.

NO. 3.

DEAR SIR—Agreeably to your request I now proceed to lay before you my opinions and views regarding the coal fields of this territory, and of the Pioneer Coal Company's in particular, to enable you to lay the same before those in San Francisco who are interested in the future progress and present prosperity of this rich country. Our coal fields are of as much importance to us as the Comstock lead, or Gold Hill claims, for the latter unless very rich would cease to be remunerative to work, in consequence of the enhancing cost of wood, whereas by the introduction of coal into competition, the mills will eventually be enabled to crush and reduce rock, which at the present time is laid aside as valueless.

To Colonel Whitman is due the honor of being the discoverer of the coal fields of this territory; and the manner in which he found the Pioneer Coal Company's ground was from indications on the surface of numerous springs, some of beautifully clear water, others having a taste like tar water, and the appearance of gas floating on the surface, and another kind having a sulphurous taste and smell. Following up the indications the Colonel found soapstone, sandstone, and a description of burnt debris covering numerous parts of the ground, all of which are certain signs of coal being under the surface.

In August last he accordingly had the ground surveyed according to law (see surveyor's certificate) and the four original locators (Colonel Whitman and his son, H. Wellington and J.R. Wells) sunk a shaft (A) on a part where the indications of coal were greatest; and at a depth of one hundred and twenty feet they struck a seam of coal three feet thick. They immediately commenced building a road (an absolute necessity) from the coal field to near Dayton, a distance of six miles, which is now completed, and is one of the best in this territory, the winter storms not having injured it to the extent of twenty dollars expense. This road cost them about three thousand dollars, and is valuable property, for it will be chartered as a toll road, and all other coal fields in the neighborhood must pay tribute.

The company having struck coal immediately put in a tunnel (B) to strike the seam, which is situated on a hill, of which the above diagram is an outline; and at a distance of one hundred and seventy-five feet the seam was struck, with a thickness of two feet, and dipping up at an angle of from fifteen degrees to twenty degrees. Sidings were then carried in on each side, a distance of forty-five feet, and the seam was found the entire length, of an average thickness of two feet. From the end of the tunnel an incline (C) following the dip of the seam, has been carried down eighteen feet with most gratifying results and prospects; for in that short depth the seam has increased from two feet to three feet two inches in thickness, so that from the ground already opened thousands of tons of coal can be taken out at great profit to the company, but appearances justify the conclusion which every one who has examined the company's mine has arrived at—that the seam will increase gradually in thickness as it is followed down, until it averages from ten to fifteen or even twenty feet thick.

The refuse coal taken from the edge of the seam burns well, emits a great heat, and is the most gaseous I have ever

PIONEER COMPANY'S COAL MINE.

seen. You can try a little in the bowl of a pipe, as did Capt. Simmons and myself. The seam at the end of the incline is entirely free from slate, or any refuse, and is one mass of beautiful black coal of the thickness before stated.

The mine is, and can be easily, worked; for by running another tunnel below the present one (at D), tens of thousands of tons of coal can be shot down the incline (C), and run out on a tramway car. You have seen the mine and can bear testimony that there is coal enough on the Pioneer ground to last all the mills ever to be built in Nevada for the next twenty years, for it crops out in several places, and one in particular—two and a half feet thick. This latter will be opened up almost immediately.

During the last autumn many persons declined to invest or build mills, for the simple reason that they were afraid fuel (wood) could not be obtained in sufficient quantities to supply the demand; now all such fears are dispelled, and the coming summer will see scores of new mills erected, on the faith and credit of our coal fields.

Wood was selling last summer from seven dollars to ten dollars per cord, and during the whole of this winter has commanded from twenty dollars to forty dollars per cord. A ton of coal is equivalent to three cords of wood, and as it is proposed to sell the coal at the mine for ten dollars per ton, and the cost of transportation will average four to six dollars per ton, it will at once be seen that wood cannot compete with coal, and that the latter will effect a great saving to the mill owner and miner.

We intend running the incline down the seam at least two hundred feet before effecting any large contracts for coal,

but in running it we shall take out from three to four tons per day, which will nearly pay the expenses of the company, and we hope to be able to do without any assessments whatever, as the indebtedness of the company does not exceed eight hundred dollars at present date. The mill owners will also advance the funds necessary, on contracts for supplying them with coal. One mill owner wants ten tons per day for the entire summer, or one thousand tons in the aggregate.

The Virginia City and Gold Hill gas companies are organizing, and they will require several thousand tons. In fact the coal has a ready market and will find immediate purchasers. We are now busily employed (having ten men at work) erecting quarters for our men—preparing the mine by lumbering it thoroughly for future work, and getting everything ready for the fine weather, when the mine will be thoroughly opened.

You have seen the ground and the company's working, and can give all the information which you know, and which I have omitted in this hasty sketch.

Yours, &c.,

WM. HUTCHINGS, Sec'y.,
Pioneer Coal Company.

We hereby certify that the specimens of coal in the box enclosing this certificate, were taken from the mine belonging to the Pioneer Coal Company, Lyon county, Nevada Territory, and is a fair sample of the seam now being worked by that company.

WM. HUTCHINGS, Secretary.
H. WELLINGTON, Trustee.

VIRGINIA CITY, March 11th, 1862,

I hereby certify that the vein of coal in the Pioneer Company's incline is three feet in thickness.

GEORGE C. HALL,

Superintendent, Pioneer Coal Mine.

March 10, 1862.

GOLD AND SILVER.—The consumption of gold and silver for coinage and household purposes is enormous, its application having increased rapidly since the discovery of gold in Australia and California. The amount of gold and silver annually taken from the mines of Europe is valued at \$25,000,000. In America the yield is computed to be \$146,000,000, and Asia produces \$25,000,000. Africa has no silver mines, but exports gold to the amount of nearly \$3,000,000. Australia is also without silver but produces gold to the large amount of \$200,000,000 a year. The whole amount of gold extracted from the earliest time is estimated at some \$25,536,000,000. The increase in the production of gold and silver is enormous, and we shall at the present rate, gain more in this respect in fifty years, than our ancestors did in fifty centuries.

Prospecting is an old feature growing into practice again since the floods. The surface of the earth, and the beds of streams, and whatever rested on them, have been so disturbed by the high water, that prospecting parties find many pans of rich dirt, without much digging. We heard one of these prospectors say the other day that he had picked up a little more than four dollars in one spot, from the rocks in the stream—having seen it through the water. Old miners are confident of rich pay in the river beds the coming summer. —[Sierra Den.

Alloy.

This term formerly signified a compound of gold and silver with some metal of inferior value, but now means any compound of any two or more metals whatever. Thus bronze is an alloy of copper and tin; brass an alloy of copper and zinc; and type metal an alloy of lead and antimony. All the alloys possess metallic lustre, even when cut or broken to pieces; they are opaque; are excellent conductors of heat and electricity; are frequently susceptible of crystallizing; are more or less ductile, malleable, elastic and sonorous. An alloy which consists of metals differently fusible is usually malleable in the cold, and brittle when hot, as is exemplified with gong metal.

Many alloys consist of definite or equivalent proportions of the simple component metals, though some alloys seem to form in any proportion, like combinations of salt or sugar with water. It is probable that peculiar properties belong to the equivalent or atomic ratio, as is exemplified in the superior quality of brass made in that proportion.

One metal does not alloy indifferently with every other metal, but it is governed in this respect by peculiar affinities; thus silver will hardly unite with iron, but it combines readily with gold, copper and lead. In comparing with their constituent metals, the following differences may be noted; in general the ductility of the alloy is less than that of the separate metals, and sometimes in a very remarkable degree: on the contrary, the alloy is usually harder than the mean hardness of its constituents. The mercurial alloys or amalgams are, perhaps, exceptions to this rule.

The specific gravity is rarely the mean between that of each of its constituents, but is sometimes greater and sometimes less, indicating in the former case, an approximation and in the latter, a recedure, of the particles from each other in the act of their union. The following tables of binary alloys exhibit this circumstance in experimental detail:

Alloys having a density greater than the mean of their constituents.	Alloys having a density less than the mean of their constituents.
Gold and zinc	Gold and silver
Gold and tin	Gold and iron
Gold and bismuth	Gold and lead
Gold and antimony	Gold and copper
Gold and cobalt	Gold and iridium
Silver and zinc	Gold and nickel
Silver and lead	Silver and copper
Silver and tin	Silver and lead
Silver and bismuth	Iron and bismuth
Silver and antimony	Iron and antimony
Copper and zinc	Iron and lead
Copper and tin	Tin and lead
Copper and palladium	Tin and palladium
Copper and bismuth	Tin and antimony
Lead and antimony	Nickel and arsenic
Platinum and Molybdenum	Zinc and antimony
Palladium and bismuth.	

It would be hardly possible to infer the melting point of an alloy from that of each of its constituent metals; but, in general, the fusibility is increased by mutual affinity in their state of combination. Of this a remarkable instance is afforded in the fusible metal consisting of eight parts of bismuth, five of lead and three of tin, which melts at the heat of boiling water, or two hundred and twelve degrees Fahr., though the melting point deduced from the mean of its components should be five hundred and fourteen degrees. This alloy may be rendered still more fusible by adding a very little mercury to it, when it forms an excellent material for certain anatomical injections, and for filling the hollows of carious teeth. Nor do the colors of alloys depend, in any considerable degree, upon those of the separate metals; thus the color of copper, instead of being rendered paler by a large addition of zinc, is thereby converted into the rich looking pinchbeck metal.

By means of alloys, we multiply, as it were, the numbers of useful metals, and sometimes give usefulness to such as are separately of little value. Since these compounds can be formed only by fusion, and since many metals are apt to oxidize readily at their melting temperature, proper precautions must be taken in making alloys to prevent this occurrence, which is incompatible with their formation. Thus, in combining tin and lead, rosin or grease is usually put on the surface of the melting metals, the carbon produced by the decomposition of which protects them, in most cases, sufficiently from oxidation. When we wish to combine tin with iron, as in the tinning of cast-iron tea kettles, we rub sal ammoniac upon the surfaces of the hot metals in contact with each, and thus exclude the atmospheric oxygen by means of its fumes. When there is a notable difference in the specific gravities of the metals which we wish to combine, we often find great difficulties in obtaining homogeneous alloys; for each metal may tend to assume the level due to its density, as is remarkably exemplified in alloys of gold and silver made without adequate stirring of the melting metals. If the mass be large and slow of cooling, after it is cast in an upright cylindrical form, the metals sometimes separate, to a certain degree, in the order of their densities. Thus, in casting large bells and cannons with copper alloys, the bottom of the casting is apt to contain too much copper and the top too much tin, unless very dexterous manipulation in mixing the fused materials have been employed im-

mediately before the instant of pouring out the melted mass. When such inequalities are observed, the objects are broken and re-melted, after which they form a much more homogeneous alloy. This artifice of a double melting is often had recourse to, and especially in casting the alloys for the specula of telescopes.

When we wish to alloy three or more metals, we often experience difficulties, either because one of the metals is more oxydable, or denser, or more fusible than the others, or because there is no direct affinity between two of the metals. In the latter predicament we shall succeed better by combining the three metals, first in pairs, for example, and then melting the two pairs together. Thus, it is difficult to unite iron with bronze directly; but if, instead of iron, we use tin plate, we shall immediately succeed, and the bronze in this manner acquires valuable properties from the iron. Thus, also to render brass better adapted for certain purposes, a small quantity of lead ought to be added to it, but this cannot be done directly with advantage; it is better to melt the lead first along with the zinc, and then to add this alloy to the melting copper, or the copper to that alloy, and fuse them together.

We have said that the difference of fusibility was often an obstacle to metallic combination; but this circumstance may also be turned to advantage in decomposing certain alloys by the process called eliquation. By this means silver may be separated from copper, if a considerable quantity of lead be first alloyed with the said copper; this alloy is next exposed to a heat just sufficient to melt the lead, which then sweats out, so to speak, from the pores of the copper, and carries along with it the greater part of the silver, for which it has a strong affinity. The lead and the silver are afterwards separated from each other, in virtue of their very different oxydability, by the action of heat and air.

One of the alloys most useful to the arts is brass; it is more ductile and less easily oxydized than even its copper constituent, notwithstanding the opposite nature of the zinc. This alloy may exist in many different proportions, under which it has different names, as tombac, similar, pinchbeck, &c. Copper and tin form, also a compound of remarkable utility, known under the names of hard brass, for the hushes, steps, and bearings of the axle, arhors, and spindles in machinery; and of bronze, bell metal, &c.

Gold and silver in their pure state are too soft and flexible to form either vessels or coin of sufficient strength and durability; but when alloyed with a little copper, they acquire the requisite hardness and stiffness for these and other purposes.

When we have occasion to unite several pieces of the same or of different metals, we employ the process called soldering, which consists in fixing together the surfaces by means of an interposed alloy, which must necessarily be more fusible than the metal or metals to be joined. Thus, the solder for gold trinkets and plates is an alloy of gold and silver, or gold and copper; that of silver trinkets is an alloy of silver and copper; that of copper is either fine tin, for pieces that must not be exposed to the fire, or a brass alloy, called hard solder, of which the zinc forms a considerable proportion. The solder of lead and tin plate is an alloy of lead and tin, and that of tin is the same alloy with a little bismuth.

Tinning, gilding and silvering, may also be reckoned a species of alloys, since the tin, gold and silver, are superficially united in these cases to other metals.

WIRE Suspension Bridges of any span and capacity erected, and material furnished.

Having been constantly engaged in the erection of Wire Suspension Bridges and Aqueducts for some years past, we are fully prepared to do such work satisfactorily at a low figure, and to guarantee PERMANENCY.

Parties who are about erecting bridges will find it greatly to their advantage to give us a call before deciding to build wooden structures, as the recent floods throughout the State have proved them to be wholly unsafe and unreliable. A number of our wire suspensions are now in use in different localities throughout the State, no one of which has been in the least affected by the freshets.

WIRE ROPE, for mining and ferry purposes, manufactured of any length and size required, being cheaper and hotter than hemp.
Scales of weights and strength with prices, furnished on application to the manufacturers. Send for a circular.

A. S. HALLIDIE & CO.,
412, Clay street, San Francisco.

ML

ROYAL HOTEL.

VICTORIA, V. I.

JAMES WILCOX - - - - - PROPRIETOR.

THE ABOVE HOTEL is conducted on the most improved principles; it is situated on Wharf street; of easy access to all new arrivals, being in the immediate neighborhood of all the wharves. The proprietor begs to inform the miners of California and traveling public, who intend to visit Victoria, that he has superior accommodations for single and married persons, or families, with or without board.

Guests entertained at the following rates: Board per week six dollars. Board and Lodgings, \$8; Board per day, \$1; Lodgings 60 cents. The Bar is furnished with Wines, Spirits, Malt Liquors, Cigars &c., all of the best quality.

N. B.—The Building is Fireproof.

Ja30

SPECIAL NOTICE.

Highly Important Invention in Dentistry.—Dr. D. STEINBERG begs leave to announce to the citizens of this city, that letters patent for his invaluable improvements in mechanical Dentistry were granted him on the 12th of November last.

This invention consists in the application of GUM ENAMEL to gold plates for artificial teeth, and are acknowledged to surpass all others in use, for their beauty, style and exactitude of fit; their weight compared with others, is less but are far more durable by the addition of the gum enamel. Specimens of this valuable invention may be seen and examined at the dental office of the undersigned, No. 648 Washington street, near Kearny. Great care and attention is devoted to the perfect fitting of teeth. Teeth extracted by the hemming process.

STEINBERG & SCHTEL,
Practical Dentists,
648 Washington st., near Kearny.

FOR SALE.

TEN DOLLAR LOTS: also 50-Vara Lots, and entire blocks of beautiful Garden land, on the line of the J. & W. Railroad, at the West End Depot. Title perfect,—being held under a patent from the United States.

Office No. 19, third floor of Nagle's Building, at the southwest corner of Merchant and Montgomery streets.

San Francisco Jan. 27, 1862.

HARVEY S. BROWN,
Fe15.

W. BOHM'S BUCKLE INVENTION.

I desire to call the attention of the public to my late invention in the construction of

A NEW STYLE OF LADIES' BUCKLES,

for which I have applied for Letters Patent. It is by far the most beautiful ornament now in existence. In the MINING AND SCIENTIFIC PRESS a full description appeared. Messrs. Bravermann & Levy, 621 Washington street, have a complete assortment of all shapes and embellishments. Their cost is no more than the old style, and their simplicity and ease of adjustment considerably enhances their value. (Go and examine them!)

Bravermann & Levy,
621 Washington street, for W. Bohm.

REMOVAL OF THE DEAD

From Yerba Buena Cemetery.

AS THE DEAD IN YERBA BUENA CEMETERY WILL BE REMOVED in a short time by the authorities, those having relatives or friends they wish disinterred, are informed that I have the most complete registry in existence of graves in that Cemetery, having added to my own records, by purchase, the books of the late City Sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges.

Everything requisite for Funerals supplied at the shortest notice.

NATHANIEL GRAY,
General Undertaker, 641 Sacramento street, corner of Webb,
Between Kearny and Montgomery.

Established in 1850.

Oxygenated Beverages.

Mr. Maumene is Professor of Chemistry at Reims, the centre of the manufacture of Champagne wine. He has recently made a series of curious experiments upon wine, into which he has forced oxygen gas under the pressure of seven or eight atmospheres. He ascertained that when wine was sufficiently old, that is, when it no longer gave a deposit, it underwent a chemical modification from the presence of compressed oxygen, even when the contact of the oxygen was maintained for almost a year. In that case the oxygen was not absorbed and the acid power of the wine was not increased. The wine thus prepared is much more sparkling, or foams more than the other kinds of common champagne. When opened it disengages pure oxygen, which rekindles an extinguished taper, and contains only such traces of carbonic acid as the wine contained before the experiment, and of which it could not be freed under a vacuum over the solution of potassa.

The taste of the wine charged with oxygen is not changed, but it produces, a little time after being drunk, a very sensible heat, like the better kinds of old wine, a general and well marked agreeable sensation. Mr. Maumene inquires whether the physician may not avail himself of this observation.

Oxygen ozonized did not oxidize wine. Although oxygen is slightly soluble in water, it is dissolved in sufficient quantity, under a pressure of eight atmospheres, to produce a strong effervescence. Such water has no taste; but by drinking it many days Maumene thought he experienced a real improvement in the functions of respiration and digestion. The preparation on a great scale of water and of wine charged with oxygen can be accomplished without difficulty. Oxygen is received in a gas-holder, a proper aspirator and a pump conduct it into a condenser where it is compressed to the extent of ten or twelve atmospheres. To be sure that this oxygen is sufficiently purified, it is passed through two cylinders, one of which is filled with caustic soda, and the other with ordinary charcoal incense powder. From the condenser it is forced into the liquid by means of the apparatus of Savarasse, which is tuned if the liquid is water, or silvered if wine or other acid or saccharine liquids are to be oxygenated.

If the pump is worked slowly, the oxygen does not act upon the oil of the piston and the oxygen contracts no odor, even under a pressure of fifteen atmospheres.

Maumene has made some experiments with protoxyd of nitrogen prepared pure, from nitrate of ammonia free from chlorine. Wine charged with this gas possesses in a high degree the power of producing the hilarious effects attributed to the gas itself. This fact Maumene determined by experiment, for the purpose it required only half a glass of the wine saturate with NO at six atmospheres.

Documents relating to the History of Amorphous Phosphorus.

Considering questions of priority, we may be allowed to establish a historical fact which has been for a long time misapprehended. All the world unite in according to Schrotter of Vienna, the merit of having discovered amorphous phosphorus. The Academy of Sciences at Paris confirmed this opinion by decreeing to Schrotter a prize for this discovery. We do not intend to contest with Schrotter the merit of having successfully studied this allotropic element. By his labors it became doubtless better understood, and he pointed out its utility and economic importance. But it is proper also to show that amorphous phosphorus was already known when Schrotter published his work in 1848. Not only was it already known, but it was recognized as such, by Berzelius, in his Annual Report, presented March 31, 1845; also by Marchand, who examined it carefully, taking it at first for iodid of phosphorus. Hence, the real discoverer of amorphous phosphorus was not Schrotter; this merit belongs to Emile Kopp, who was then principal chemist to the Faculty of Medicine at Strasbourg. The memoir in which he spoke of this red powder was presented to the Academy of Sciences in 1844, from whence it passed into the principal scientific Journals of Europe. It was in a research upon iodydric ether that Kopp made us acquainted with the red phosphorus, its preparation and its more important properties. It is there stated that: "In preparing the iodydric ether by means of alcohol, phosphorus, and iodine, there remained, as a residue, a solid pulverulent substance of a deep red color; this substance when well washed, is insipid, inodorous, and is but feebly attacked by the oxygen of the air; this is nothing but phosphorus in its red state. It can be dried over the water bath, without being sensibly oxidized, but it is difficult to drive away the last traces of moisture. By distillation it turns black and is transformed into ordinary phosphorus which is condensed," &c. &c.

We thus see that amorphous phosphorus was duly recognized, and its individuality perfectly established, by Kopp, in 1844; it had even passed the ordeal of the critics, and remained as a simple body, so that it is justly recognized, notwithstanding Marchand at first regarded it as iodid of phosphorus.

The principal French and foreign scientific Journals mentioned it in 1844 and 1845, so that this result of Mr. Kopp has obtained all necessary publicity. It is true that nothing in the title of the memoir set forth the important fact which has occupied our attention, but it is none the less true that four years previous to Schrotter, Emile Kopp had

already shown the existence of phosphorus in its red state, had made known a method of obtaining it, and had recognized its most essential properties. It is proper, therefore, to give each observer his due, to Kopp the discovery of amorphous phosphorus, to Schrotter its application.

Messrs. Lockwood & Ewell begs to inform their patrons and the public generally that they have constantly on hand a large and well assorted stock of gents' and boys' furnishing goods, and their facilities for disposing of such, on easy and accommodating terms, are equal, if not superior, to any other fashionable establishment in this city. Gents desiring clothing of any kind made to order, will do well to give them a call at their new place of business, situated on the corner of Merchant and Montgomery streets.

Taxing Mining Claims.

Here is what Holmes, of the Mariposa Gazette, says in his last issue upon the matter:

A general and growing feeling is observable throughout the State for the taxing of mining claims, which idea if broached and advocated five years ago, would have rendered its advocate a suitable subject for a mob, or if two years ago would have made him the victim of anathemas and execration of harking puppies, verbally nud by publication. The theory of these prostitutes was that a miner must necessarily be "honest"—next hard working—next, that he knew more than most people. Mountain members of the Legislature were afraid to touch the matter for fear of disapproval and loss of popularity, and consequently the business has been suffered to go on and the great interest of the mountain counties has not paid at all for its protection. This county of Mariposa has been put to more expense in protecting mining interests than in any other way. Miners are always quarrelling and when they complain to blind or hoodwinked goddess, it is thus: The People vs. So and so. Yet not a cent do they contribute, nor have contributed to the support of local laws and for the adjudication of their difficulties, except by Poll Tax, which is always avoided by running into the bushes if the collector is seen in time to gain such cover. Thus it is that a poor man's cow, his cabin, his improvements connected with a home he has come here to establish, has to pay a rich mining man's tax—has to pay all of it. One robs the earth, the other improves the surface of it. One is, in four-fifths of cases transient, and the other permanent. Then again a man can change his property from value in improvement whereon he is taxed to mining interests and escape tax. Now is there another such a condition attached to revenue law in any State of the United States, or in the world? That property of any description can be changed from one visible real value to another of equally visible value—such as selling one thousand head of cattle taxed, and buying a portion of the Pine Tree Veia, Bear Valley, and escape tax, is an anomaly. We care very little about the matter, for the people should have regulated it long ago. What we hate, however, is to see a man, who has stuck up a house temporary to improvement, and has a few ducks, chickens, a cow or two, and perhaps some sheep, pay the tax of an owner of a \$1000 mining claim. The law of making mining claims pay their proportion, if passed now, would

be a good deal like locking the stable door after the horse had been taken; for easily worked and ready available mines are gutted. No wonder that settlers get along slowly and are discouraged, or that mining counties, nine-tenths of them, are deeply in debt.

Pyrites.

At the Literary and Philosophical Society, Manchester, Dr. Grace-Calvert said he wished to draw the attention of manufacturing chemists to a very simple and rapid method which had been devised by the eminent chemist M. Pelouze, Master of the Paris Mint, for determining the amount of sulphur existing in pyrites. He (Dr. Calvert) was induced to do so, believing that any process which would simplify the long and troublesome operations now followed to ascertain the value of this mineral would be useful to many members present at this meeting. The process consists in mixing intimately together one part of pyrites, thoroughly pulverised in an agate mortar, with five parts of carbonate of soda, seven parts of chlorate of potash, and five parts of chloride of sodium, and placing the whole in an iron spoon, which is gradually carried to a dull red heat. The mass, when cold, is first washed with cold water and then with boiling water, until the whole of the soluble matter is removed; and this solution is tested with a standard solution of sulphuric acid. As 100 grains of carbonate of soda require 92.45 of monohydrated sulphuric acid, or $S O_3 H O$, it follows that the quantity of soda in the carbonate of soda employed will decrease in proportion to the quantity of sulphur from the pyrites converted into sulphuric acid, which will have neutralised a corresponding quantity of the soda in the carbonate. This mode of assaying is so simple that the author states that he can determine within 1 or $1\frac{1}{2}$ per cent. the value of a sample of pyrites in the space of an hour's time. M. Pelouze also states that by employing the following proportions of the same materials, the manufacturer can determine the amount of sulphur in burnt pyrites. Five parts of the latter substance are mixed intimately with five parts of pure carbonate of soda and five parts of chlorate of potash.

Oregon Mines.

An able cotemporary—the Republican of Eugene city—grows quite poudrous over the anticipated rush to the mines in its vicinity. We admit that the rush may be tremendous thither, but it will be incalculable to estimate the sudden return of the we-hestricken dubbed men. The author, however, "draws it mildly," by advising those on farms or other paying occupations to remain at home; he remarks:

We are pleased to see the laudable enterprise manifested by our populace, but we greatly fear that in the matter of mining enterprise the thing will be a little "over did" this spring. Many men who are well situated to do a handsome business at home are making haste to go to Salmon, without securing tenants for their farms, and some without even leaving their ground seeded. This we think is a great error, both in a general and in a particular point of view. It will be worse for the country, which will be scarce of provisions and feed, next winter at best, and it will be worse for the individual who could realize a handsome profit for his crops. It is not safe to calculate that more than one man out of every three or four who goes to the mines will make it pay well, say even as well as they might do at home on their farms. Now it would be far better for the men who will ramble around over the mining region, prospecting, and probably making about expenses—some not doing so well—were they at their homes making plenty of bread and meat for themselves and for sale to those who do make it pay. We would not discourage those who are prepared to go and leave things in a proper condition at home from going, for we believe the prospects are good, but we would urge all who have farms to see that their land is planted before they go.

Mining Operations.

We are glad to notice several of our most extensive quartz mining companies, learning wisdom from experience, are taking measures to prevent the recurrence of so great a calamity to their business as the filling up of mines by water.

The Messrs. Watts, O'Keefe and Judd, have recently completed a side tunnel into their mine, by which we understand they have reduced the amount of water some fifty feet, which, with the aid of a powerful pump they intend putting in, will effectually prevent their mine from stopping work again on account of a superabundance of water.

The Allison Ranch company started on Monday last an additional pump of very large calibre to free their mines from water. This pump in addition to those previously in use will keep their mine in working order in any season.

The North Star company at French lead intend running a tunnel some two thousand feet so as to materially assist in draining their mine.—[G. V. National.

FIRST MILL IN COSO.—Messrs. Hitchens & Monroe, on the 22d of Feb., had completed a quartz mill with ten stamps, in the Coso mines. It is now in successful operation, and is the first steam mill that ever puffed in those mines.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

TUESDAY.....MARCH 25, 1862.

The MINING AND SCIENTIFIC PRESS published is at 522 Merchant bet. Montgomery and Sansone sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and illustrations on wood, stone, copper, steel, etc. STEREOPTING and ELECTROPTING, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a wide circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. Having the best legal talent near the Patent Office in Washington City as our associate, we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

REMOVAL OF THE "PRESS" AND PATENT AGENCY.

The business of this office having become quite extensive, it therefore made it incumbent upon us to remove from our offices in the Government House, where we had scarcely room enough to do our regular office business. We occupied said premises for nearly two years, and were really loth to leave them. Circumstances have placed us so that we now can enjoy separate offices for the printing of our MINING AND SCIENTIFIC PRESS; and the applicants for letters patent need no longer be interrupted by the thousand and one inquiries heretofore made, while we occupied said offices.

We have moved our printing rooms to Merchant street. No. 522, between Sansone and Montgomery up stairs, and the

PACIFIC PATENT AGENCY

and the Editorial rooms are now eligibly situated in the former U. S. Court Building, northeast corner of Battery and Washington streets, in room 24. All persons having business with us will favor us with a visit as early as convenient. Letters will be addressed to us in accordance with the above.

Banham's New Process.

In a recent issue we gave an illustration of Mr. Banham's New Process for separating gold and silver bearing ores. Since then we have seen his working apparatus, together with his celebrated Excelsior Quartz Mill, which may be seen in operation on Second street near Howard. Of its efficacy, and certainty of results, we had then as well as now the highest anticipations. That this process must eventually become the process few will question, since economy of time, expense and labor, may be in a manner dispensed with, when compared with other processes. By this mode of procedure an entire new feature in this country will be inaugurated. A most effectual amalgamation is had with the application of electricity; and we believe nothing in the manner as he applies the same is now on record; for tailings or sulphurets Mr. B. has the most invaluable invention. His field in California, Nevada-Territory and Mexico, will prove of incalculable value.

Pacific Metallurgical Works.

These works have recently reduced considerable ores. New additions of machinery have been made, and the works are now in successful operation. The return of the week before last, were a bar of eight hundred and twenty ounces; last week's work six hundred and twenty-five ounces, all of which were Lower California ores. The shipments by steamer are regular, which may be estimated at from twelve to twenty tons.

NEW PLANING MILL.—W. H. Dearing, Architect and Builder, is erecting a new steam planing mill, on California street opposite the Railroad Depot, for a New York Company. The location is excellent, and we hope the new firm will do a prosperous business.

F. H. B. Society's Ball.

Tuesday evening last the anniversary ball of the above society took place at Platt's Hall. The attendance was composed of the elite of this city, and altogether presented one of the most brilliant arrays of female beauty ever congregated. Considerable credit is due to the managers who arranged the affair, especially the musical department and refreshment. Though from five to six hundred persons were present, yet all found room to enjoy the tripping polka. The programme too seemed to have been well made up, and we venture to say that every card in the fair hands were all marked with engagements from top to bottom. One reason why the entertainments given by this society are pleasant, is because that all those who attend them are mostly intimately acquainted with each other, hence their great sociability. Mr. L. King, the President of the society, was called upon during the intermission to speak, but the din, clatter and chatter proved an effectual barrier, to catch even one syllable. At the wee hour of early dawn we hastened to our sanctum, delighted with the evening's pleasures.

Senator Latham.

Our thanks are due to Senator Latham at Washington for copies of books and pamphlets published by Congress. What we desire mostly are a number of Patent Reports of Mechanics—no copies for 1860-61 having been received here yet. If our kind representative will do us the favor to forward such, we shall ever, as heretofore, consider ourselves much indebted to him.

Gold in Sandwich Islands.

The Polynesian, a Hawaiian paper has the annexed interesting items about some alleged new gold discoveries, or a "sell," very much like our temporary fevers—as now rage, vide Cariboo and Salmon River. Read what it says:

Considerable excitement was created in Honolulu and Koolau during the early part of this week, owing to the circulation of a rumor that gold had been discovered in the hills of Kahaluu, a land in Koolau-poko. From an unimpeachable source we learn the following facts connected with the above reputed discovery:

On Sunday evening last, three gentlemen returning to Honolulu from Neawa, in Koolau, overtook on this side of the Pali a Mr. Lehman, and entered into conversation with him, from which they inferred at first, and afterwards understood, that Mr. L. conceived that he had discovered gold deposits in the rock on the other side of the island. The next morning, after giving notice of the said discovery at the Government House, Mr. L. brought to these gentlemen some specimens of rock which he supposed to contain gold. One of the specimens said to have been taken from the above locality was analyzed by Drs. Hillebrand and Smith, and yielded gold dust to the value of about fifteen or twenty cents. Other specimens were handed to Mr. Kopka and to Mr. Rawson, jewellers, but no gold was found in them by either of these. Mr. L. anxious to investigate the fact further, offered to the first mentioned parties to take them to the spot whence he had obtained his specimens, in order to have the rock examined in their presence, and verify its identity with that from which the gold had been extracted. His offer was accepted, and on Monday afternoon the party started for Ahimamau, adjoining the place, where rumor had preceded them concerning the pretended gold discovery. Tuesday morning the party, with L. as guide, started for the hills and ravines of Kahaluu, and on arriving there found the ground occupied by the resident lessee of the land, and some fifty or sixty natives, more or less armed, who forbade them to proceed farther. A parley ensued, which resulted in all offering to join the exploring party. Mr. L. having pointed out the rock from which his specimens had been taken, with great labor and perseverance succeeded in drilling a hole in it, with a view to blasting off a piece sufficiently large so as to observe its formation and contents.

In the meanwhile the people from the neighboring lands were flocking to the spot, and probably as many as one hundred and fifty were congregated at and around the locality, deeply interested in the proceedings. Five gentlemen from Honolulu had arrived during the day, three of whom remained to be present when the explosion took place, and the rock, flying in pieces, revealed to the expectant crowd its hidden treasures, consisting of black basalt, here and there dotted with pyrites of iron and an occasional streak of calcspar, but of gold not a shadow of a trace. Everybody having satisfied himself with taking specimens from the broken rock, and the crowd being convinced of the futility of the labor and the loss of a day's work, a general scattering took place, and by nightfall the deserted ravine with its wounded flank was left in solitude to converse with the moon and stars upon man's curiosity and man's cupidity.

Ever since, specimen rocks have been as thick in Honolulu as "Autumn leaves in Vallambrosa," but whence derived and what containing is not always known to the exhibi-

tor; and though the Koolau rock yielded no gold, still a few believed that it may yet be found in this country.

Not pretending to be so well versed as our cotemporary in geology and mineralogy, we can offer no comments upon its lucubrations that, because the existence of quartz has been proven in this country, and unmolten rocks have been thrown out by the Kilauea, therefore the possibility of gold here is attested. But we have known extensive tracts of quartz rock that never had a speck of gold, and we believe it is a question now with some of the learned institutions of Europe whether the granite itself, the so-called backbone of the earth, is not merely the debris of a previous formation through volcanic action.

Earthquakes.

"California is not in the line of heavy shocks, although in building houses it would be well to make them substantial enough not to fall down before they are finished. Earthquakes always have a wave like motion.

Prior to the year 1300, the number of recorded earthquakes experienced in the world was three hundred and eighty-seven. From that time until 1800, there were three thousand eight hundred and forty; and from 1800 until 1858 there were no less than 4020; this however must not be supposed to be the real—only the recorded increase. From the record of Dr. Trask, California averages from three to fourteen earthquakes per annum. No human life, however, has thus been destroyed, except in one instance, in California and that was during the earthquake that, in 1812, threw down the church of the Mission of San Luis Obispo, and killed thirty or forty persons. The Sierras, at a recent geological period were formed by upheaval; they are part of that great chain of volcanic mountains stretching from Cape Horn to Behring's Straits, which furnishes the most extraordinary display of the workings of the vast central fires of the earth. Chile, Bolivia, Peru, Central America and Mexico, are the present fields of active volcanic agency. In Chile there are no less than thirty vents vomiting forth flame and cinders, and lava. Here the power is dormant: the tremendous convulsions which have torn up California, took place at the close of the Tertiary epoch, before the race of man appeared on the scene. Then it was that the auriferous detritus in the river beds was covered over with pumice, the bones of the mastodon and—the original Digger.—[Prof. Whitney.

Physiological effects of the Electric Telegraph.

It appears that constant watching of the needles of electric dial-plates begins at length to produce an unpleasant effect upon the eyes of some of the operators. After laborious service, and especially after service at night, the retina is frequently so affected that for a considerable time all objects appear double and shrouded in haze. This affection is developed only at those stations where the needle telegraph is employed. This telegraph is no longer used in France, it is but little used in England, except the needle telegraph of Wheatstone. In France the printing telegraph is preferred. Two new systems are about to be adopted; the first that of Hughes, an American, the other that of Caselli, of Florence. The first prints the Roman letters with a velocity which permits the transmission of over twenty words per minute; the second, called the Pantelegraph, reproduces everything antographically, writing, linear drawings, portraits, landscapes, &c. &c., with a velocity of eight to ten words of ordinary writing or 60 words written with the characters of Morse.

A VALUABLE NUGGET.—David Fairchild, residing at Cerrito, and writing February 27th, relates the following: Young Dick Brown, of this village, located a claim upon the ranch of William Taylor, at Hogg's Diggings, on Saturday last. To-day he took out a slug worth \$576. Adjoining this claim the young Messrs. Ferguson have been at work some five or six weeks, who have averaged over \$15 per day to the hand. They have also taken out coarse gold, one lump weighing as high as \$250. Near their present claim, some two or three years ago, these same young men took out a nugget worth near \$500; about the same time, Hogg took out a piece worth \$1,500. These diggings are about four miles southeast of Auburn, on an air line. During the winter of 1849-'50, a young man who labored with me upon the bar of the North Fork of the American, during the fall of 1850, spent the winter at Auburn, where he had the good fortune to find a nugget worth \$4,500. Both of these diggings appear to be upon the same range of gold bearing quartz.

COON FOR HOG'S DIGGINGS.—Last week three "strapped" miners took up a claim, and almost the first work they done was to find a nugget worth six hundred dollars! This is a fact; and Hog's Diggings stock is 'on the rise.' Persons hunting diggings which turn out gold brickbats, can find them by coming through Forest Hill. This is also now the nearest route to Silver Land, Kern River, Salt river, Hell's Delight, Gold Bluff, Cariboo, Nisqually, Fraser River, Gold Lake, Salmon River, Shirt Tail Canon, to Paradise, etc., etc. (Persons just coming into the country would do well to cut this out of the paper and keep it handy for reference.—[Placer Courier.

Mining Prospects.—Our mountain exchanges, says the Marysville Express, appear to all agree that the present is a very flattering mining season, and that more gold will be secured this year than during any former period since '49. The floods have torn open new places in the mountains not before prospected, and exposed to view rich deposits, while many of the streams have been made to flow over golden beds. Already vast amounts have been picked up in various sections of the country, and the miners are encouraged to pursue their labors with renewed energy. Mining in the ravines and rivers will be prosecuted this year with more than ordinary vigor, which will have a tendency to build up all branches of industry and general trade. We congratulate miners on the prospects before them.

COLORADO MINES.—Reports are current here in relation to the prospects of the mines on the Colorado river, which seems to be very encouraging. We learn that parties who have lately arrived here from the mines above named, report them to be very rich, and that the work of opening has so far advanced as to put on end to further doubt as to their superiority. A prosperous work will be opened in that mining locality the coming season, which it is said will banish all future speculation in relation to the Colorado district. We are henceforth promised reality.—*S. News.*

A MINERS' COUNTY CONVENTION.—The Nevada Transcript referring to various mining improvements used on the North San Juan Ridge, suggests that it would be an excellent idea to call a county convention of miners, who might in that way have an opportunity to compare notes, exhibit their different processes of mining, and thus, by a mutual interchange of ideas and plans, secure considerable profits to all concerned. The suggestion is certainly a good one, and ought to be carried into effect if practicable.

RICH DIGGINGS.—A miner named John Hall, says the Nevada Democrat, has recently made a rich strike on Rock Creek near Nevada. His claims on the creek were not in condition to work, by reason of the high water, and he employed his time in prospecting an unusual piece of low ground, supposed to be worthless, and found the dirt was rich; he accordingly put in sluices, hired men, and in the course of a week or two, took out nearly six thousand dollars. The diggings are limited and would probably be soon worked out.

WOOLEN MANUFACTURES.—We are pleased to note that the proprietors of the Woolen Factory, of which Heyneman, Pick & Co. are the principals, at Black Point, are contracting to rebuild the same, at least of its former capacity. The plans therefor are ready and being estimated upon. The proprietors intend that the work of reconstruction shall be completed at the earliest possible moment. The factory was destroyed by fire some time since.

Since the river has fallen back to its old channel, the Chinamen have resumed work on the bar, and it presents the appearance of a lively mining camp. The bar pays very well, even for the slight working the Celestials give it. They do not dig deep, but do surface or stripping work and are content with it.—[Butte Dem.]

NEW ENTERPRISE.—We learn that a company are erecting works for the manufacture of turpentine, a few miles above the city, says the Placerville Times. We see no reason why it should not prove a lucrative business, as we have some of the finest forests of pine and fir to be found on the continent.

BIG CONTRACT.—The claim holders on Gold Hill, Nevada Territory, have closed a contract with David Hunt, who agrees to keep their claims dry for one year at two thousand five hundred dollars per month, and to raise all the rock they need for crushing at one thousand two hundred dollars per month.

LAND SLIDE.—A heavy land slide occurred on the side of the mountains back of the town of Scott Bar, on Scott river during the late heavy rain. The mass of earth and rocks slid into the town, bearing down and crushing the house of James Grabam and others. Fortunately no lives were lost.—[Yreka Union.]

COMPLETED.—The long flume and ditch conveying water on the flats and ravines between Dry Creek is now complete, and three companies are using water from it. A reservoir is now being constructed which will be completed next week. The flume will carry three hundred inches of water.

COAL MINES.—In Nevada Territory, several companies have been recently formed for the purpose of working newly discovered coal leads.

HOBBS, GILMORE & CO.,—WINE VAULTS.

In behalf of new manufacturing establishments on this coast, and a few remarks on the culture of vines, and their subsequent transition into wines and other liquors, commercially reviewed, may be of interest to our readers.

A few years since it was demonstrated that the soil of California was declared admirably adapted for the cultivation of vines; but the missionaries, more than fifty years ago, were successfully employed in raising quantities of grapes from vines, either indigenous to California or brought here with them from Europe. B. D. Wilson, Esq., is owner of an estate near Los Angeles, situated immediately under the foothills of the San Gabriel mountains; virgin soil and careful nurturing of the vines transplanted by him, have been the means of bringing his wines to the favorable notice of our consumers; these are said to be the only wines which more than compare with some of the oldest and celebrated brands of wines in Europe. This seems to be attested by the innumerable orders received from dealers on this coast, China, Japan and the Pacific Islands. From the shipments made to the Atlantic States, it was asserted there by connoisseurs, and complimentary notices from the press, that the quality far exceeded any of those made in the West.

The different kinds of wines and liquors now made from these vines are port, cherry, claret, angelica, white wine, cognac, peach brandy (which latter is made from white wine). The wines now put up here by the above enterprising firm, Messrs. Hobbs, Gilmore & Co., in this city, who also are the exclusive agents for Mr. B. D. Wilson, are from several years culture. The average yield from 180,000 vines is about 200,000 gallons of wine per annum. The old vines now in their vaults are from the year between 1856-57. These wines have the peculiar taste of the German "Bocksbeutel," a brand that attained some celebrity in that country. At present the agents make sales to dealers and families, and in shipments to various parts of the world. Their building and vaults are eligibly situated on the S. E. corner of Market and First streets, of which the above illustration is an excellent representation. The agents will give any information respecting their operations and apparatuses of their manufacturing.

We recommend them as first class business men, and for promptitude in all their commercial relations, by which they will establish for themselves an enviable reputation on this coast.

Mineral Wealth of California.

RUSS MINING DISTRICT.—This rich region of silver takes its name from the superintendent of an exploring party or expedition, which set forth on a voyage of discovery from San Francisco, March 4, 1861. The inception of this exploring party was induced from the belief that the Comstock silver lode of Washoe, Nevada Territory, was but the weak part of a strong belt of mineral; and the result of the explorations has proven such to be the case. The success which rapidly followed the discovery and partial development of the Comstock lode created many prospecting parties, whose field of operations were from Washoe through the mountains south of that place, and by some of those parties another part of the mineral belt was discovered, about one hundred and twenty miles south from Washoe, and named as the Esmeralda district; the ores of this district were

found to be of great value, but the lodes generally are not very thick, which creates a belief in the minds of practical men that the volcanic action at this particular point has been of less force than in the Washoe or Russ districts; be that as it may, another extension of mineral having been found in direct line with that of Washoe, and at a great distance therefrom established the belief that at some point, even further south, other links of the great chain may be discovered of greater extent, if not of richness, than those comprising the Washoe and Esmeralda districts. Accordingly, Mr. Horace P. Russ, who has been identified with the mineral interests of California for many years, formed the New World Exploring and Mining Expedition, and was elected by its members as superintendent of the same. After travelling from San Francisco, about five hundred miles southeast, a detachment of the company ascended the Sierra Nevada mountains to their summit on the western slope, and prospected the same for a distance of about forty miles, but no mineral of any kind could be found; the entire formation of the mountains being gneiss and felspar, the latter in great excess. On the return of the party to camp, in a place called Cane Brake, at the base of the Sierras, it was determined to cross the mountains through Walker's Pass without delay, travel up the edge of the Grand desert to Owen's Little Lake, divide the forces, work up from that southern point towards Esmeralda, giving the country between the starting point and the latter place a thorough examination by lateral lines, running from the eastern base of the Sierras due east about sixty miles: by this method it was believed that no part of the mineral belt of sufficient magnitude to be worthy of attention could escape detection or discovery by the explorers. The country east of Owen's Lake is without exception the most desolate and forsaken of any that the white man of this continent has ever traveled over. Extinct craters form the broken mountains, whilst the valleys are trembling from some hidden thunders below, masses of pure sulphur were deposited at different points, a jet of steam rising from the center of each mass, in puffs to the height of from ten to twenty feet, and the shuddering traveler feels the uncertainty of the ground over which he is passing. Hell's Half-Acre is the title of a chosen spot, about fifteen miles east of Owen's Little Lake; it is not a misnomer, for the rumbling below the hissing stream at many points, and the perfume of sulphur everywhere, claims it as an entry to the territory of Beelzebub; but American energy knows no boundary in its research: that half-acre has been intruded up, and it is a little singular that since a regular trail has been established through that country as a short cut to the Coso mines these jets of steam no longer play, and the tremulous motion of the ground has ceased. Many mountaineers believe that his Satanic Majesty, being offended by the intrusion has moved his underground works further south.

At or near Owen's Little Lake there is a wall of black lava, which stands almost perpendicular (in the highest place about five hundred feet) and continues unbroken for four or five miles. This lava is the first evidence presented on the eastern slope (to travelers going through Walker's Pass) of decided volcanic action of more recent date than that which formed the great Sierra chain. At a parallel line, thirty-seven and a half miles from this wall (east), there is a corresponding line of lava, and these two walls or lines form a kind of basin, inside of which are the craters &c., heretofore described; as soon as the eastern wall or line is crossed towards the east the face of the country is changed, and detached portions of quartz lodes are plainly visible. The matrix is here found to contain both gold and silver, but not in sufficient quantity to promise the existence of a future mining region.

Continued in our next.

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends who wish disinterred, are informed that I have the most complete registry in existence of graves in that cemetery, having added to my own records by purchase, the books of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains over hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple, and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer: together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 60 pages is devoted to metalliferous veins; the second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess; and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

A BOOK FOR THE MINER.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character: and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work the Miner's Companion and Guide, and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer: it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's treasured its hidden treasures.—[Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths fine. 3cts per oz.
" from 300-1000ths. to 750-1000ths fine. 7cts " "
" " 750-1000ths to 950-1000ths " .14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to the extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Mills and Dies of Iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Milling Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Mule, and Circular Saw Mills; Single Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these single machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hancock's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Pump Mills; Boiler Fronts; Wind Mills; of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Opbri Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver aving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 2d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

GOLDEN STATE FOUNDRY AND MACHINE WORKS.

Our illustration presents the premises of Messrs. Palmer, Hanscom & Co., who have recently purchased the entire establishment of Mr. G.K. Gluyas, in the works formerly known as the Sutter Iron Foundry. These premises are eligibly situated Nos. 19 and 21 First street. It was however previously known as the Eagle Foundry, and will be well remembered by the pioneers of this State. The patterns and models of machinery from all these establishments are all in complete preservation, and have been retained till to-day; among which we may mention the flouring mills of Alviso. The present proprietors were formerly well known in connection with the Golden State Foundry, on the corner of Battery and Bush streets. They have moved their entire stock, tools, patterns, &c., to their new or rather old and well established works, which of course makes this the most complete machine works extant.

The buildings and foundry occupy an area of 90 feet front, by 137½ feet deep, or otherwise two water lots. Their

facilities now for doing all kinds of casting and finishing can therefore not be superceded, being business men, and well conversant with the demands and requirements in every branch of their professions. An important feature, one which they have particularly excelled in, is the casting of grates for mantelpieces, also stoves, which for style and beauty almost exceed the importations.

Mr. Palmer is the inventor of the steam chest, as applied by him to Knox's amalgamating pans. These pans have gained for themselves some reputation for the separation of metalliferous ores. They are, however, particularly employed in erecting mining machinery, such as quartz mills, amalgamators, steam engines, and other implements. The whole establishment has been re-arranged and refitted, with ample steam power for doing the largest piece of work. A visit to their place will repay those interested. Their prices for doing work we understand are reasonable, and they will insure satisfaction.

J. S. SMITH'S PATENT ELLIPTIC BED BOTTOM.

The annexed novel invention, presents one of the best devices for beds which has thus far come within our notice. In the Atlantic States its general use has been adopted, both in public and private establishments, on account of its innumerable advantages over other devices, as it is more durable, easier to rest on, makes no dust, has no room for vermin to live in, is easily moved about, but above all consideration is its cheapness.

Messrs. J. Dale Burton & Co. have recently opened an establishment in this city for the manufacture of furniture. And these are the exclusive agents for the patentee on this coast, who will hereafter endeavor to introduce this ingenious invention into general use. As will be seen in the drawing, A represents a spring, to each end of which are attached rings, so that the same may be suspended to the frame of the bed. B is a cross-bar, upon which a series of slats (C) are secured: the whole of which may be attached to any and all

kinds of beds, rendering such bed far more comfortable and easy than any spring mattress. Its cost is but a trifle, therefore it must eventually become a necessity. One of our city physicians speaks of it as follows:

"In recommending the Elliptic Spring Bed Bottoms as the very best invention of the day, as an easy and healthy form of spring bed—in cases of spinal complaint, or where a patient is compelled to use a bed for a continuous period—no form of bed bottom seems to me so well adapted to secure ease and repose as this.

While a student under the celebrated Dr. Bland, of Sydney, we had occasion to import a hydro bed from England, at a very heavy cost, which did not fully meet the requirements of the case, while this Elliptic Spring Bed Bottom I believe would have afforded this relief so desirable. During my residence at Grass Valley, Nevada Co., as pastor of Emanuel Church, a case came under my notice

where this Elliptic Spring Bed would have been most advantageous to a patient suffering from a painful and protracted sickness.

H. SMEATHMAN, Surgeon.

The manufacturers invite the public to their store, No. 7 First street, near Market, where the same are on exhibition.

GET THE BEST

WHICH IS ALWAYS THE CHEAPEST IN THE END.

J. S. SMITH'S PATENT ELLIPTIC SPRING BED BOTTOM,
Manufactured by

J. DALE BURTON & CO.,

Manufacturers of and Dealers in all kinds of

BED ROOM FURNITURE.

Also constantly on hand or made to order, Bedsteads of every description, Bureaus, Tables, Cane and Wood Seat Chairs, Stools and Office Chairs and Desks. Teachers' Desks and School Furniture manufactured or imported to order; Hall Furniture, Settees, &c., at

THE LOWEST RATES FOR CASH.

Don't fail to call and see the BED BOTTOM that will last longer, that is easier to rest upon, that makes the least dust in the rooms, that has no place for vermin to live, that is the most convenient to move, that is always in good order, that is warm in cold weather and cool in warm weather, and above all other considerations,

THE CHEAPEST BED BOTTOM EVER OFFERED IN THIS MARKET!

For sale by

J. DALE BURTON & CO.,

Homesteads Cheaper than Proposed under the Shafter Bill.

UNDER THE PROVISIONS of what is known as the Shafter Bill, it is proposed to sell the city title to homestead lots for twenty-five to two hundred dollars each.

The undersigned will sell homestead lots within the limits of the city, and miles nearer to the business center than many of the lands covered by the Shafter Bill, and place the party in immediate possession of the same, without present trouble or prospective lawsuits, for from \$10 to \$20 each. THE TITLE is absolutely PERFECT, being a Spanish Grant, fully confirmed and patented by the United States. The Shafter Bill respects this title: the city authorities respect it; the District Court and the Supreme Court of the State, as well as the District Court and Supreme Court of the United States respect it: besides the TITLE HAS BEEN FOREVER QUIETED BY A FINAL DECREE AND JUDGEMENT AGAINST THE CITY so that there is not even a cloud or shadow upon it. Whoever purchases one of these lots will buy a lot, not a lawsuit.

FOR PORTLAND, OREGON, AND VICTORIA, V. I.

The Steamship

PACIFIC

CAPTAIN BURNS

COMMANDER,

Will leave Folsom street Wharf for the above ports, on

MONDAY.....MARCH 24 1862,

At 4 o'clock P. M.

For Freight or Passage, apply on board, or to

HOLLADAY & FLINT, Proprietors,
Office 407 Washington street, opposite the Post Office.

Bills of Lading furnished to shippers of Cargo. No others will be signed.

WHILE YOU HAVE THE MONEY,

MAKE SURE OF A HOME!

NEVER HAZARD THE LAST DOLLAR!

To Cariboo and Salmon River Miners, and all others who wish to purchase LOTS in San Francisco with a PERFECT TITLE:

The undersigned will sell Building Lots for from \$10 to \$200. Also, 50 vara Lots and entire Blocks of the most beautiful gardening lands in the city and county of San Francisco, on the line of and at the WEST END DEPOT OF THE SAN FRANCISCO AND SAN JOSE RAILROAD. Persons desiring to invest a few dollars, or hundreds, or thousands of dollars, would do well to call on the undersigned, as he deals ONLY IN LANDS WITH A PERFECT TITLE, to wit: those held under

A PATENT OF THE UNITED STATES!

Persons residing in the interior, or who are about to go to the Cariboo or Salmon River Mines, can purchase this property and leave it without any fear of adverse claims or titles springing up in their absence. The undersigned will, if desired, give his personal attention to the assessing, paying of taxes, etc., on all lots purchased from him, and will forward to each non-resident purchaser his tax receipts, free of all cost save the actual amount of the taxes.

Office—No. 19 third floor of Naglee's Building, (south-west corner of Merchant and Montgomery streets.)

NO. 4.

STOCKTON MALE AND FEMALE SEMINARY.

The above beautiful illustration, represents what the title indicates. It is said to be most pleasantly located at Stockton and ranks as one of the best Institutes on the Pacific Coast. In a circular before us, we perceive that the seventh session is about to ensue, or has already commenced on the 31st of March, the same to continue for five months. The entire School is managed by Dr. Cyrus Collins, A. B., and his estimable Lady, together with a corps of competent assistant teachers. It is governed like any public Institute, that is, being vested with a charter, having a regular board of officers, and the trustees are principally residents of Stockton. This Institute is acknowledged by those who have children educated therein, to be the best and most disciplined School, in this State. The following comprises the plan of study pursued therein, the Principal prefaces the same by saying that,

The first aim of this Institution is thoroughness; and although any plan proposed can only be disciplinary, yet we have chosen that course which will be the most practical, involving those sciences most available in common life. Beginning with fundamental principles, the student is carried by natural and easy gradations, through a course of study calculated to strengthen and invigorate the mind, and prepare it for headful action.

Our Course of study comprises two Departments—a Preparatory of two, and an Academic of three years. The studies of the preparatory course, the first year, comprise reading, writing, orthography, Arithmetic (Thompson's Rudiments), primary geography, grammar and composition. The studies for the second year are rhetorical reading, arithmetic, book-keeping, geography, history, grammar, penmanship and composition. The studies of the Academic course—first year—algebra, geometry, natural philosophy, physiology, rhetoric, physical geography and composition. Second year—trigonometry, astronomy, natural history, botany, logic, intellectual philosophy and composition. Third year—political economy, moral philosophy, evidences of christianity, helles letters and composition.

The ancient and modern languages, music (instrumental and vocal), drawing, painting and ornamental needlework, optional through the whole course. Pupils can omit, with the consent of parents or guardians, any of the above studies, but none while he entitled to the Diploma of Graduation

who have not completed the whole course. It appears that the terms are convenient, as will be seen by the annexed schedule of prices in each branch or department.

For board and tuition, in common English branches, per session, \$150 00. music, per session, \$50 00; painting or drawing, \$25 00; ancient or modern languages, each \$25 00; washing, per dozen \$1 50; for tuition and board, per annum, \$260 00.

We believe that is customary that the fees or payments in every case are made in advance at every session and is so stated in their circular. If parents and guardians would have their children well educated they should place them at once under the maternal care of Madame Collins and the kind Principal. We may soon revert to this School again, in the mean while we wish them success.

Mercado Mountain, or Cerro de Mercado of Durango.*

DEDICATED TO HIS EXCELLENCY THE GOVERNOR OF THE FREE AND SOVEREIGN STATE OF DURANGO, DON JOSE DE LA BARCENA.

The repeated mineralogical expeditions I have made to the "Cerro Mercado," enable me to give your Excellency a scientific report on the same, and also an idea of its configuration, origin and relations with the surrounding hillocks, by the topographical map I enclose herewith. I likewise remit to your Excellency a collection of fossil which I gathered from the mountain, arranged in their mineralogical order and marked from 1 to 50; and two jewels with obsidian and magnetic iron, semi-topaz and other ores from the "Cerro de Mercado."

As it appears that this enormous mass of iron has never been properly analyzed, and that it continues calling the attention of the public and especially of your Excellency, I am induced to give some light on this deposit of ore, the only to be found in the Republic, and to dedicate my mineralogical toil to a person who in spite of the many political dis-

turbances has ever been prompt to encourage and aid mineral industry, and the development of arts and sciences which from all points of view, are the surest and finest basis of public welfare.

I hope your Excellency will be pleased to accept this essay as a proof of my gratitude, and with it my respects.

FRED. WEIDNER.

DURANGO, Jan. 6th, 1858.

To his Excellency the Governor.

REPORT ON THE "MERCADO MOUNTAIN" OF DURANGO, OR A BRIEF MINERALOGICAL, STATISTICAL, HISTORICAL AND METALLURGICAL REPORT ON THE "CERRO DE MERCADO," BY THE ENGINEER OF THE STATE OF DURANGO TO THE GOVERNMENT OF THE SAME. JAN. 6TH, 1858.

At the same rate that the industrious Mr. John Flores with the assistance of Mr. Mark Ison both of the San Francisco Foundry (State of Durango) is successful in the reduction of iron after the methods practiced in England, the Mercado Mountain is acquiring for Durango, and for the whole Republic such an importance, that it appears to me expedient to give your Ex. V. some information on the extraordinary dimensions and interesting nature of this deposit of iron, unrivalled in the world; for, the great deposits of iron ore explored in Switzerland, Vizeaya, England, Prussia and Germany are commonly pockets, veins or surfaces of more or less extension, partly above and partly below the ground, and mixed with the gangue itself, whilst the deposit of iron known under the name of Mercado Mountain, or Cerro de Mercado is a whole mountain of pure ore, completely isolated and rising in grotesque and commanding peaks, over varas above the level of the Valley of Durango.

All that has ever been written and circulated through the world, on this prodigious phenomenon, has the defect of being either partial and superficial or erroneous and adulterated, so that an exact idea has never been formed.

According to the abridged history of the "Conquest of the Independent Mexican Empire by the Francisco Pejos," Book IV., it appears that the Cerro de Mercado derives its name from Don Gines Vasquez del Mercado, who by order of the Government of Nueva Galicia (Jalisco) with a division of troops came to conquer the valley of Guadiana (Durango). This avaricious gentleman having learned from some adventurers from Florida, that a marvellous mountain, strewn with silver and gold, existed in the Guadiana Valley; and this statement being affirmed by some Indians of the Valparaiso Sierra, he undertook the expedition, and examining the mountain discovered it was iron, and hastened to Guadalupe to report the failure of his expedition. But he did not reach the Capital, for, displeased with himself, fatigued from so rough a journey and wounded in skirmish with a party of the Indians on the road, he died in the town called Juchipila, leaving his name immortalized on that mountain, in whose search he had sacrificed his life.

This, however did not dishearten the conquerors, for in 1558, Martin Perez, first Alcalde de Zacatecas, after discovering Fresnillo and Sombrerete, directed his expedition as far as "El Nombre de Dios," (fifteen miles east of Durango,) and in the same year Francisco de Ibarra, with a more respectable division, completed the conquest which he soon extended over to Chihuahua. Thus we see that, civilization in Durango is due first to the Cerro de Mercado.

During the three succeeding centuries of the Spanish Vice-Royalty, the Mercado Mountain has been excavated in many places in quest of mastadons of silver and gold, entered treasures and all sorts of extravaganzas—but never did they dream of searching for iron, which precisely renders it so important. Sinor Don Santiago Vaca Ortiz, Governor of the State, succeeded in getting a company of Englishmen to establish a foundry on the right bank of the river Timal, in 1828.

My countryman, the illustrious Baron Von Humboldt, in his political essay on the Kingdom of New Hispania, lib. 3, chapter 8, paragraph 11, Spanish edition of 1827, says that Don Faustos Elhnyar, director of the Mineral Tribunal of Mexico, gave him some specimens from that enormous mass of malleable iron and of nickle which was said to be found in the vicinity of Durango, and that its composition according to the analysis of Vauquelin and Klaproth was identical with that of the areolite which fell in Traschina, near Agram, Hungary, in 1751, and that its weight exceeded 400 times that of the areolite discovered by Mr. Rubin de Celis, in Otumpa, in Tucuman.

This coming from so respectable an authority as the Baron Von Humboldt, has created the idea that the Mercado Mountain was also an areolite, fallen in some remote period from the planetary space to our earth. But as early as 1843 this was contradicted in a monography "Cerro Mercado and Foundry of Durango," published in the Mexican Museum, by the very learned Don Jose Fernando Ramirez, who maintains that the specimens the Baron Von Humboldt obtained, in the greatest probability did not proceed from Durango, but from Zacatecas, where an areolite exists from time immemorial, and was discovered by a German mineralogist.

It must be remembered that the illustrious Baron never visited Durango, and could therefore have no idea of the Mountain in question.

I coincide with the Licentiate D. Jose Fernando Ramirez, before mentioned, in that opinion; because to suppose that such savants as Messrs. Elhnyar and Humboldt should have mistaken the meteoric iron of Yacasecas for the metallic ores of the Mercado Mountain, is absurd; and I will only add that the specimens, might well have proceeded from Durango, for they could have been extracted from the Works at Guadalupe near the City or from one of the Haciendas on the Florida and Concepcion rivers on the road between here (Durango City) and Chihuahua. In these two last mentioned places I have really seen, on the road-side, two sacks of malleable iron and which I took to be areolites; but, as I will subsequently prove, none but a tellurial or terrestrial origin can be attributed to the Mercado Mountain.

Mr. John Bowring an employee of the English Mining Company of Guadalupe y Calvo deserves credit for having first calculated the geographical position of the mountain, whilst on a journey through Durango.

He calculated the longitude of the Eastern Peak to be 107 deg. 29 min. West of Paris; and the latitude 24 deg. 4 min. North. In his very interesting notes, published in some paper here, he says that this Mountain could supply all the iron-works in Great Britain, which turn out annually 15,000,000 hundred weights of iron, 330 years; and that in the same time, the Mountain could produce 9,900 millions of

dollars, or more than seven times all the gold and silver coined from 1690 to 1803 in the mint at the Capital of Mexico.

Mr. Baki in his Dictionary on Geography and Mr. Carlos Orbigny in his illustrated Dictionary on Natural History published by Mr. Guerin—did nothing but copying and adulterating the erroneous reports concerning the Mercado Mountain, circulated by the Baron von Humboldt, and by the authors of the "Travels around the World and in the two Americas."

Mr. Orbigny upon being suggested by Mr. Ward of the importance of the Mercado Mountain, and on the Iron Works, copied what related to the nature of the former from Humboldt not without adding new inaccuracies.

Finally in the memoirs dedicated to his Excellency the Minister of Industry in Mexico, by Julius Guillemin engineer and member of the Mexican commission, in regard to the Universal Exhibition of Paris 1855; after lamenting the absence of iron, being a metallurgy of the greatest importance, and stating that the industry in this metal is considered as the thermometer, of the progress of a people in civilization;—he continues giving notices on the actual state of the Iron Works in the Republic, to-wit: Saa Rafael, Santa Fe, Guadalupe y Encarnacion, Tepotlan, Tlacotalpan, Atotonilco, el Grande, and on the Iron Works at Durango he says:

"The Mercado Mountain is very rich in iron ore, much celebrated and described by Mr. Bowring; a Spanish Foundry established near it, has made excellent iron, from rocks naturally detached from the Mountain. This foundry had a stream of water and cheap fuel; but as it is very far from places of great demand, it has been discontinued.

"The pieces of machinery for rolling single sheets, imported from abroad are not mounted but laying idle." In this state of things I undertook several excursions to Mercado Mountain, going all over it and examining all its parts and details till I had obtained that sufficient data to form an exact idea of its real state and nature.

To conceive the enormous mass of iron this Mountain contains, let us see its dimensions. From West to East it measures about 1750 varas (5110 feet) its width is 400 varas (1168 ft); and its height above the level of the St. Antonio Square, is 234 varas, giving for the contents of that Mountain 60 millions of cubic varas. From the volume of the Mountain, and from its specific gravity we obtain a secondly that the quantity of metal it contains reaches 5,000 millions of hundred weights, which would produce when cast, allowing but 50 per cent. 25,000 millions of metallic iron, this sold at 10 dollars a hundred weight represent a total of 25,000 millions of dollars.

The above calculation includes nothing but the ore seen on the surface; but it is reasonable to believe that the mass under it is much greater: for this is the case with all metallic deposits of this class and is proved also by a mound at about three-fourths of a mile from the Mercado Mountain, rising 10 varas and extending towards St. Ignacius Ranch. This hillock, seen on the background of the diagram must connect subterraneously with the principal mountain (Cerro de Mercado) forming one vein and both penetrating like the roots of a tree to the very depths of the earth, forming there a great deposit of metal. Both the Mercado Mountain and the mound spoken of, form but a small part of that great deposit, which at some remote period yielding to the force of internal vapours broke out in a fused state, bursting through and tearing the crust of the earth and spreading itself over it.

The hypothesis that the "Cerro de Mercado" is an issue from the depths of the earth, as may be reasonably judged from the crevices, now covered, on it; and the supposition that its mass extends to immense depth and spreads subterraneously, is corroborated by the facts that, following a line from its centre, in a westward direction, we find on the haciendas, Tapias and Murga, a number of ferruginous lodes, and extending the same line towards the east we find a little iron mound, (on the road to Panuco,) and finally that line produced, passes through the center of the Brena, the volcanoes of which, I judge to be cotemporaneous or in immediate precursors to the eruption of the Mercado Mountain, from their black color, great specific gravity, and large proportion of iron in their basaltic rocks.

The igneous origin which I attribute to the "Cerro de Mercado" in accordance with the principle of modern geology is called *eruptive* or *volcanic* in contradistinction to the *neptunic* origin, which formation bears evidence of growth under water, and in opposition likewise to the *cosmic* or *meteoric* origin which like the areolite's fall from the planetary space on our earth.

In assuming that the Mercado Mountain is a volcanic eruption, and thereby contradicting the meteoric origin which has generally been accepted as the real cause, I am based on the following reasons:

1st. The form of areolites is that of angular rocks or detached stones, as if they were fragments of prisms or oblique pyramids covered with a dark coat, generally glossy, like pitch; buried or simply stuck in the ground, whilst the physical aspect of the Mercado mountain is the same as that of every older volcanic mountain, being composed of a series of cones naited by a sort of backbone, if I may so call it, crowned with bluffs and peaks which may be considered like as many centres of erupcion. All these peaks rest firmly on the rocks forming the base.

2nd. The areolites known to this day, are of very insignificant dimensions weighing from 2 to 5lbs only. One,

however, which fell in Olumba, Peru, is said to weigh 300 weights. But I venture to say, notwithstanding the colossal areolite of Olumba, that all the areolites taken together are not equivalent to the one thousandth part of Mercado Mountain.

3d. The chemical characteristics of areolites are iron, nickle and cobalt, in a natural or malleable condition; whilst in the mass of the "Cerro de Mercado," nickle and cobalt are not present, and the iron is not found in a malleable state but as an oxyd.

4th. Metallic boulders from the Mercado Mountain of the size and shape of projectiles, are strewn all over the surrounding grounds, not only on the lowlands but also on such high hills that, apparently, none but volcanic force of the mountain could have planted them there.

5th. The most striking evidence of the volcanic apparition of the Mercado Mountain, is seen on the surrounding rocks and mounds. Wherever the porphyritic rocks are in contact with it, their color, lustre, and texture have suffered alteration, as if they were reverberated from and fragments of the porphyritic mass, and these fragments are now wrapped up in crystalized magnetic iron. On the southern side of the mountain the same porphyritic rocks contain particles of maceons iron, which could have embedded themselves there only by the process of sublimation. On the south-eastera side, the porphyritic rocks are so impregnated with oxyd of iron, that they are partially converted into almagre (red ochre). On the central table of the Mercado Mountain, and on the slopes of the same, porphyritic rocks and banks are found; which could have been planted there only by the eruptive iron itself—all prove that Mercado Mountain is of a more modern formation than the porphyritic grounds around it; that the porphyritic rocks occupied at one time the ground on which Mercado Mountain now rests; that the iron of the latter impelled by volcanic forces broke through the crust of the valley, through the porphyritic rocks, dislocating, raising, burning everything before it, and enveloping in the masses many fragments and debris of the rocks it destroyed.

The size and configuration of the mountain is admirable. not less so, however, is the great variety of metallic and rocky fossils to be found on and around it; a complete collection of which I send your Excellency.

We will mention the principal ferruginous ores:

Magnetic iron constitutes the greatest part of the Mountain, and especially of the peaks. It is of a black color, of granular and crystalline texture and its surface crevices and cavities are all covered with groups of crystals of the same, magnetic iron.

The three most common combinations of these crystals are the octahedron with the hexahedron; the octahedron with the dodecahedron; and with octahedrons.

The detached rocks of magnetic iron, found strewn on the slope of the Mountain, are rounded and acquire in the course of time a sort of gloss, which gives them the appearance of native or malleable iron. Every piece of this metal has a very decided polar magnetism, attracting magnetic water with one and repelling it with the other; which virtue makes it known and used as load-stone.

It seems to me, that the natural magnetism increases with the fineness of the grain, and that powerful load-stones are more frequently found in caves, than anywhere else on the Mountain.

This magnetic iron, found also in Sweden in great masses, is pure oxydulo of iron, and produces as much as 72 per cent. of metallic iron: it is tardy in melting and when molten runs thick, but in exchange it makes wrought iron of the best quality.

2d. The Red iron or oxyd of iron forms pockets in the preceding ore, in the western peak, for instance. It is in parts compact, of conoeoidal fracture, in parts crystalized in leaves or rhomboidal planes, intimately united to each other. In this case the ore is called micaceous. On a small hill to the south-east of the Mercado Mountain, this oxyd of iron is so dusty that it colors the hands; it has on this account been called "*Almagre*" or Red Ochre.

One hundred parts of this ore contain 30 of oxygen and 70 of iron. Less fuel is necessary for its reduction than for that of magnetic iron, before mentioned and is excellent for the manufacture of steel.

3d. Argillaceous Iron, found on the south-east brow of the Mountain, is compact, of a greyish color spotted red, and contains besides oxyd of iron a good deal of Alumina and some silica. These ingredients make it so fusible that when smelted alone, it sometimes corrodes the stones of the furnace. It gives from 20 to 30 per cent. of metallic iron.

4th. Silicious Iron or red ferruginous jasper is found, together with the preceding specie. It is essentially a silicate of the oxyd of iron, and though not very rich, it gives excellent molten iron, when smelted with the preceding ore.

5th. Grey Iron or hydrated oxyd of iron is found in pockets and veins in the magnetic iron on the northern side of the Mountain in combination with quartz, chalk, clay and fenaquita. In a place, on the Mountain called "Jesus Maria y Jose," this ore is found striped with gray and redeish bands; and blue and black ones, alternately. The two latter colors are due to the peroxide of manganese. On account of its earthy and impure state, this ore is not favorable to the extraction of iron.

Five specimens from the Cerro de Mercado, extracted by the new Director of the San Francisco Foundry (Durango) were

analyzed by Mr. H. Poyl in Philadelphia, on the 25th May, 1857, and gave the following results, very close indeed to my calculations:

In 100 parts. Oxyd. Iron. Silica. Alumina. Carbonate lime. Water. Iron.

Ore, 1st class	16.3	2.9	0.1	0.3	0.7	69.77
" 2d class	92.8	5.4	1.2	0.0	1.7	65.3
" 3d class	98.2	0.6	0.6	0.0	0.7	68.8
" 4th class	71.0	28.1	0.2	0.0	8.7	49.23
" 5th class	67.1	26.5	0.6	0.6	6.4	60.58

The ferruginous ores common to iron mines and entirely absent in the "Cerro de Mercado," are the hydrate or yellow ochre of iron and the carbonate of iron or iron-spar. Sulphurous iron, commonly called white bronze, and phosphate of iron, are also, and fortunately, absent; for when the ore contains these two substances, in smelting, the phosphorus and sulphur are not entirely destroyed, but combine with the iron; the sulphur rendering the latter soar when warm, and the phosphorous brittle when cold.

Thus we see the great disadvantage offered to the reduction of iron ore when combined with sulphur and phosphorous. But in the Mercado Mountain, the ore is entirely free from these substances, and has moreover the following circumstances in its favor:

1st. It is situated in the vicinity of a populous city, near a large river and in the centre of numerous gold and silver mines.

2d. It is accessible from every quarter, and requires no expensive work to explore it.

3d. All its iron is in the state of an oxyd,—the most easily reduced to metallic iron.

4th. Its metal is almost pure, being in combination with no rocks, quartz or extraneous metals, which is the case in other countries, requiring therefore, a preparation previous to smelting.

5th. and lastly. It contains a great variety of ferruginous metals, which facilitate the smelting; thus, the pure oxyd of iron, which is devoid of earthy substances, can be rendered fatty by combination with another ferruginous ore abounding in them.

Aluminous metals, when smelted alone, combine with the silica of the stones of the furnace, forming silicate of alumina, and on the other hand, metals containing much silica, combine combine with iron and the silicate of iron thus formed is lost in the fatty substances; whilst by mixing both metals, such inconveniences are avoided, the silica of one metal saturates with the alumina of the other, the fatty substance liquates and the smelting is carried on with neatness economy and excellent returns of iron.

We have yet to consider the other ores and rocks your Excellency will find in the collection, which are partly from the Mercado Mountain and partly from the fossils of the same mountain, found within the iron ores.

As before stated, the ground on which the Mercado Mountain rests is of a porphyreous nature, that is to say is composed of a volcanic rock, in whose compact mass of silica and feldspar, grains or crystals in quartz, mica, feldspar, hornblende, etc., are found.

In the map of the Mercado Mountain I herewith send your Excellency, you will see the hills called respectively, Santuario and Espiritu Santo, standing like two scouts on the southern side of the great iron mountain. Both are composed of porphyritic quartz, in almost horizontal strata. This quartz is excellent for masonry and is being used in the building of the Penitentiary of Durango.

On the southern side your Excellency will perceive a long hillock, detached from the same Mercado Mountain and fronting the city. This mound furnishes excellent material for mill stones, mortars and grinders of any kind. It consists essentially of feldsparitic porphyry and abounds in lodes of chaledony and common opal. Its base sinks into a porphyritic stone called *pedra pez*; in various places it is impregnated with minaceous iron, and in its point of contact with the Mercado Mountain, it is composed of a porphyritic conglomerate of fragments of porphyry buried in a cement of micaceous iron. In a small bluish quartz vein of this same hillock, a little mine called "Del Agua" has been opened. On the main road which runs along the foot of the hill I found several pieces of obsidian, resembling black crystals, in translucent thin chips; the same stone that was used by the ancient Mexicans for making axes and points of arrows, and which is still used for mourning jewels.

Continuing on this feldsparitic porphyry towards the south-east of the Mercado mountain, we meet a talcose porphyry in which we find white leaves of talc of an iridescent lustre; instead of grain of whitish or reddish feldspar, generally found in that porphyry.

On the side of the road to Tinaja, passing over this property there is an open well, called the *Cinco Senores* (Five Lords) but no vein is seen. At the bottom of this well the porphyry is much decomposed, and in the place called Red Hills it is so combined with oxyd of iron that it can be used as a paint (*almagre*). On the upper side of these hills it combines with another class of rock, which instead of feldspar and talc of the above description, contains dark greenish crystals of hornblende, in a homogeneous mass of quartz and feldspar, which I classify as porphyry of hornblende. The whole base on the east and north-east of the Cerro de Mercado is composed of it. This porphyry of hornblende rock has the very remarkable feature of being composed of little balls, one inch in diameter about; this state of separation is the result, no doubt, of the high temperature of the volcanic apparition of Mercado Mountain.

Some of these little balls are pure feldspar of a rosy color, and others containing hornblende are wedge-like crystals of a light greyish color. This grey color is due to a very rare fossil called *esfenida*.

A mine called "Divino Preso" has just been opened in that porphyry, but has produced no silver; for what appears to be silver ore is hornblende which very seldom is associated with argentiferous ores.

Parallel to the northern side of Mercado Mountain runs a long hillock in which silica is prevalent; the rocks of which are modified and changed owing to sudden, violent and igneous apparition of that mass of iron. The western end of this hill is particularly interesting to the mineralogist on account of its variety of silicious porphyries of every color, and also for the veins of quartz of onyx, cornelian, and jasper. The last mentioned stone is partly red partly yellowish, and of many other brilliant colors.

The opposite end of this hillock is considerably colored with red oxyd of iron, and its centre in contact with Mercado Mountain, which must have suffered the volcanic fire bear every sign of reverberation: all its porphyry is white and friable; and an enormous bed of silica has been converted almost wholly into a white powder, very satile and light of pure silica. The latter under the name of polishing stone has been successfully used in an old glass manufactory, in the Foundries, at the silver smith's etc.

On the western slope of this hillock are some black volcanic rocks, which have rolled from a higher place. These rocks contain white nucleous of calcareous spar which indicate that this porphyry ground has been overwhelmed by a modern eruption of amigaloid basalt.

But the ores which should call your attention are: 1st. A flour-spar of beautiful green and red; 2d, some precious crystals of amethyst or brown crystalized quartz; and lastly any number of topas colored *fenaquillas*. The two first were found on the foot of the Mercado Mountain, but whence they were detached is unknown, the first was found with a number of other rocks, of the same kind, and the second, in concentric hulks. I have extracted more than 3,000 *fenaquillas* from one ferruginous vein on the north-east by north slope of the Iron Mountain. The latter are nearly all hexagonal crystals, some are prismatic and others regular pyramids, resembling crystalized quartz so much that it has been called *Deceiver* or *Fenaquita*.

These crystals are not in their original state. They have lost in hardness, but even in their present condition they take a bright polish. To show this I have had some cut and mounted in the jewels I send your Excellency.

The matrix of the vein in which these crystals are found is the hydrated oxyd of iron (black and grey) both of which are earthy and combined with sealy lime stone. But I have also found crystals of the same nature in magnetic iron, at different places. For in the peak, surmounted by the Cross, facing the Tinaja Ranch, the *fenaquita* forms a real rock in which crystals of common hornblende and radiating stone have been found. A small mine was once opened here and called "Nuestra Señora de la luz."

Another fossil worthy of note is the *piquenita* or semi-topaz. It is found in oblong straw colored prismatic crystals in magnetic iron on the top of the Mountain. The centre stone of the breast-pin I remit your Excellency, is of that class.

Common Garnet, always associated with magnetic iron, in the European Iron Mines and in those at Coahuila and Nuevo Leon, has not even traces here. But in exchange, on the southern side of the highest peak lays a mass of magnetic iron with a rose colored crystal which looks like a ruby.

Heavy and calcareous spar are but seldom found. It is believed however, judging from the impressions made on many flat magnetic iron stones, of tubular and scalene crystals, that they have existed in profusion.

The unusual tint and bright metallic lustre of these fossils has led the ignorant mass of the people to believe that the Cerro de Mercado contains treasures of gold and silver, and many excavations have been made in quest of them, but the deeper they went the more they found of Iron. Based on the reasons I have exposed in preceding pages I am justified in saying that all labor in search of silver or gold is to no effect, and it will show the ingratitude of mankind who would search for gold where Providence has so graciously given them an iron treasure which if properly disposed of will contribute more to the prosperity and aggrandizement of Durango, than all the silver mines in the Republic.

Dr. Tozer, formerly of Sacramento and one of the pioneer physicians of that place, has removed to this city. We have known him in early times, and recomend him as an able, kind and affable man. Read his card elsewhere in this issue.

MEDICAL CARD.

DOCTOR VANZANDT, of St. Louis, Missouri, has just arrived in this city, and taken an office on Bush street, No. 212, (formerly occupied by the U. S. Head Quarters), opposite the Metropolitan Hotel, where he will be happy to see his old friends and acquaintances from Missouri, Iowa, Illinois, Indiana and Kentucky now residing in California. In addition to the Practice of Medicine and Surgery, Dr. Vanzandt will give his special attention to the treatment of Diseases of the Eye as well as to other chronic affections. San Francisco, April 1st, 1862.

SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San Francisco.

Generally much better to apply for foreign patents simultanously with the application here; or if this cannot be conveniently done, as little time as possible should be lost after the patent is issued, as the laws in some foreign countries are so patents to any one who first make the application, and in some way many inventors are deprived of valid patents for their own inventions. Many valuable inventions are yearly introduced into Europe from the United States, by parties ever on the alert to pick up whatever they can lay their hands on, which may seem useful.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vntly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Address, J. SILVERSMITH, SAN FRANCISCO.

Miners, Inventors, Agriculturalists, Capitalist and Mechanics, will find it to their advantage to subscribe for the MINING AND SCIENTIFIC PRESS—being the only journal of that class published upon this continent. Issued every Saturday at four dollars per annum.

BOUND VOLUMES of the above journal can be had on application, also any back numbers.

J. SILVERSMITH, Publisher,

PATENT AGENT AND SOLICITOR, San Francisco Address: Look Box, 537, Post Office, San Francisco, or Wells, Fargo, & Co.

VULCAN IRON WORKS CO.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street, near the Gas Works, San Francisco. Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc. The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought-iron framing.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

TUESDAY.....APRIL 1, 1862

The MINING AND SCIENTIFIC PRESS published at 522 Merchant bet. Montgomery and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

We execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. SKETCHING and ELECTROTYPING. Designs of every description—Buildings, sketches of towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. Having the best legal talent near the Patent Office in Washington City as our associate, we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

REMOVAL OF THE "PRESS" AND PATENT AGENCY.

The business of this office having become quite extensive, it therefore made it incumbent upon us to remove from our offices in the Government House, where we had scarcely room enough to do our regular office business. We occupied said premises for nearly two years, and were really loth to leave them. Circumstance have placed us so that we now can enjoy separate offices for the printing of our MINING AND SCIENTIFIC PRESS; and the applicants for letters patent need no longer be interrupted by the thousand and one inquiries heretofore made, while we occupied said offices.

We have moved our printing rooms to Merchant street, No. 522, between Sansome and Montgomery up stairs, and the

PACIFIC PATENT AGENCY

and the Editorial rooms are now eligibly situated in the former U. S. Court Building, northeast corner of Battery and Washington streets, in room 24. All persons having business with us will favor us with a visit as early as convenient. Letters will be addressed to us in accordance with the above.

Wanted.

The proprietor of this journal desires one or two gentlemanly persons to act as solicitors or canvassers for this paper. Good wages allowed.

WANTED.—A copy of the Patent Office Reports (Mechanical) for 1857.

Emigration to Mexico.

We present in this issue a most elaborate report upon the "Cerro de Mercado," a scientific paper upon the capacity, range and extent of its mineral resources but more especially that of iron, by Mr. Fred. Weidner Esq., of Durango, Mexico. There can be no greater benefit or emolument realized, even not excepting the richest gold and silver mines, than a mine of nearly pure iron in our vicinity. Every one must be more or less conversant with the product of iron; its value; from whence it comes, and to what purposes it is generally applied. The bulk of this metal comes from Great Britain, for which the United States pay annually several millions of dollars, and the increase of manufactures, rail roads, etc., still keep augmenting the demand from year to year. There are a few iron districts which are actively pursuing the smelting of iron in the United States, but the yield of these cannot be compared with the accompanying report which gives 70 per cent. of pure metal in the *Cerro de Mercado*. Eventually, (we hope however soon,) the Pacific Railroad will have to be constructed, and with the rails made of American iron, would be of the greatest benefit to every citizen in the Pacific States. The Government of Durango, in Mexico, have authorized certain parties to organize a com-

pany, and have vested them with all necessary power to work and develop its mineral resources, and aid them with every facility and franchise required for this grand project. They have also sent here a Commissioner of Emigration, as will be seen in another column and to which we shall refer hereafter. Thus the inducements offered to the people of this State, are of too great importance to be lost sight of.

Lecture on Mexico.

Alf. A. Green, Esq., recently from Sinaloa, Mex., delivered before a densely crowded audience, a very able and comprehensive lecture on Mexico, its resources, condition, etc. We have read many works and conversed with many intelligent people from that country, but none portray with that clearness and impartiality which characterized the speaker's discourse on that country. His thorough knowledge of the country, their customs and language, must have been the means by which he obtained all the traditions, history laws, and statistics, all of which he rendered most intelligible in plain Saxon. His appeal to emigrants, together with his advice as to their conduct when colonizing there, was expressed in fit and most appropriate terms.

MEYER'S NEW CHURCH ORGAN.—California boasts now of factories, something above the usual articles of immoderate necessity. Mr. Meyer a few days since placed, in Platt's Hall, a new organ for the German Catholic Church, which he manufactured in this city. In style and appearance it far exceeds many imported organs; but this has little to do with instrument comparatively speaking. The leading feature should be the capacity and range of tone.—We find that Mr. M. has introduced upwards of 600 pipes, which are most judiciously and compactly arranged—even the front or ornamental pipes are real and made to speak.—The encasement though plain, looks extremely neat and handsome, and altogether, this organ possesses many advantages especially for convenience to the performer over the old style. Mr. M. deserves credit for his enterprise. The concert held last Monday with the aid of this organ, was a new thing here,—well attended—and proved highly successful.

SENATOR M. S. LATHAM.—The *Daily Globe* of January 31 inst., published at Washington, contains an elaborate and statesman-like argument or speech held on that day by our much esteemed Senator, who heads this article, on the expulsion of Bright of Indiana from the Senate. Although our Senator ably remonstrated against the expulsion yet, the Senator in question as will be recollected, was finally deposed. The people of this State are much indebted to Mr. Latham for his indefatigable efforts to secure for us the greatest boon that the Pacific States have wished for, a Pacific and Atlantic Railroad, now under consideration, and though Congress has thus far refused to act in the matter we must nevertheless appreciate our Senator's endeavors.

MESSRS. Goodwin & Co., the enterprising furniture dealers on Washington Street opposite the Market, have on hand one of the best assortments and styles of new furniture to be seen in California. Their terms and prices are certainly in conformity with the times, and all those requiring such articles should therefore not fail to see Goodwin first.

SAM BRANNAN, Esq.—This energetic, prompt and thorough business gentleman, has opened an extensive "Real Estate, Commercial and General Agency," in the Masonic building, No. 420, Montgomery street, between Sacramento and California streets. Elsewhere in this issue he has an extensive advertisement, comprising landed property, stock, homesteads, etc., etc., to which we refer the reader for further particulars.

WONDERFUL INVENTION.—We have received the following note, which well illustrates the spirit of American invention:

Sir: Mr. William Bullock having invented a Self-Feeding, Double Lightning, Steam Power Press, capable of printing on both sides ten thousand papers per hour, requiring but three hands, two men and a boy, to operate it, and having built and set up one of the said presses, in the office of the Cincinnati Times, where it is now in successful operation, we are prepared to contract for and furnish said presses, with the right to use them, upon short notice. Respectfully yours, etc.

GEO. S. SELDEN & Co.

Music and the Drama.

San Francisco can boast now of a greater number of places of amusement, in proportion to her population, than any other city in the Union. The "American Theatre," notwithstanding its former *incubus*, as alleged, on account of its locality, has proved unfounded, since the House is nightly filled with an appreciative audience. The "Metropolitan" likewise draws well, but not so well as the "American." The fact is that a great many of our stock actors here are "played out," and new ones should take their place, and introduce new attractions and new pieces. The "Varieties" (minstrel) was crowded to excess last evening to witness *L'Hawaiian en California* in their native performance. We leave a description of their skill in the terpsichorean art to greater experts than ourselves. Suffice it to say the curtain dropped in the midst of their performance ere they had finished.

Hayden's Creation.

This Sacred *Oratorio* has been duly performed; but of all the leading, directing, or managing, it exceeded the late performance of the Cannibal Island dancers of the Varieties. The choristers which had previously been well drilled, bad to manage in spite of an "unruly baton" in the hands of an ignorant musical enthusiast, and yet went through the choruses tolerably well. We understand that it is to be repeated soon; should such be the case we sincerely trust that the managers or trustees of the Society will leave the directorship to better and abler hands. The *Recitativos* in this *Oratorio* are beautiful and should succeed the choruses in time which not being so, materially marred the performance on account of bad, and improper time beating, and a general lack of musical knowledge on the part of the leader. We know the Society possesses superior musical talent,—and why did they not place such in the capacity of Conductors?

Taxing Mining Claims.

Here is what Holmes, of the Mariposa Gazette, says in his last issue upon the matter:

A general and growing feeling is observable throughout the State for the taxing of mining claims, which idea if broached and advocated five years ago, would have rendered its advocate a suitable subject for a mob, or if two years ago would have made him the victim of anathemas and execration of barking puppies, verbally and by publication. The theory of these prostitutes was that a miner must necessarily be "honest"—next hard working—next, that he knew more than most people. Mountain members of the Legislature were afraid to touch the matter for fear of disapproval and loss of popularity, and consequently the business has been suffered to go on and the great interest of the mountain counties has not paid at all for its protection. This county of Mariposa has been put to more expense in protecting mining interests than in any other way. Miners are always quarrelling and when they complain to hind or hoodwinked goddess, it is thus: The People *vs.* So and so. Yet not a cent do they contribute, nor have contributed to the support of local laws and for the adjudication of their difficulties, except by Poll Tax, which is always avoided by running into the hushes if the collector is seen in time to gain such cover. Thus it is that a poor man's cow, his cabin, his improvements connected with a home he has come here to establish, has to pay a rich mining man's tax—has to pay all of it. One robs the earth, the other improves the surface of it. One is, in four-fifths of cases transient, and the other permanent. Then again a man can change his property from value in improvement whereon he is taxed to mining interests and escape tax. Now is there another such a condition attached to revenue law in any State of the United States, or in the world? That property of any description can be changed from one visible real value to another of equally visible value,—such as selling one thousand head of cattle taxed, and buying a portion of the Pine Tree Vein, Bear Valley, and escape tax, is an anomaly. We care very little about the matter, for the people should have regulated it long ago. What we hate, however, is to see a man, who has stuck up a house temporary to improvement, and has a few ducks, chickens, a cow or two, and perhaps some sheep, pay the tax of an owner of a \$1000 mining claim. The law of making mining claims pay their proportion, if passed now, would be a good deal like locking the stable door after the horse had been taken; for easily worked and ready available mines are gutted. No wonder that settlers get along slowly and are discouraged, or that mining counties, nine-tenths of them, are deeply in debt.

(Continued from last week.)

The primitive rocks are here broken into such small fragments as to deny the presence of lodes of mineral in any considerable length, for it is obvious that when the strong vertebra of the universe is shocked into atoms, a delicate thread of siliceous, weakened by its embrace, soft metallic properties must share a similar fate; hence, the exploring party, after taking a survey for eight or ten days, concluded that section of the country as valueless, and, finding their force moved off in opposite directions, north and south-east. The details as presented in the reports of the sections of the exploring party, are too voluminous to be rendered in this communication. The privations were such a character as usually attend explorations beyond the pale of civilization.

The party who went south-east discovered on the Panamint mountains heavy lodes of sulphuret of antimony, from twenty-five to sixty feet in thickness: five hundred pounds of ore has recently been brought to this city for assay. It is thought that by sinking upon these lodes the excess of antimony will give place to argentiferous galena, or the more perfect sulphuret of silver. To prove this a superintendent with six miners, with an adequate quantity of provisions and tools, have been dispatched to that region, known as the Telescope District, (name derived from the peculiar shape of the mountains), to sink at least fifty feet on one of the lodes, and convey to San Francisco as much of the ore from the lowest depth as they may have facilities for carrying thence by pack animals.

The party who went north-west were more fortunate—in fact a description of their discoveries cannot be believed by those who have not seen them, and even then their magnitude could not be comprehended. About seventeen miles north of Owen's Great Lake, the superintendent at he saw a range of eight miles from the camp, believed that he saw a range of mountains of a different character from any hitherto found—clean and unbroken upon the surface, formed in ridges as though they contain some vertebra, which sustained their peculiar shape. On the following morning the superintendent, accompanied by Dr. George, one of the explorers, left camp for the purpose of prospecting the range described, then within about two miles the croppings of the large lode, apparently quartz, became visible to the eye upon the summit of one of the foot hills attached to the main range. Upon arrival at the base of what seemed at a distance to be a low foot hill, upon which the croppings rested like a formidable fortification, it was found to be difficult of ascent. After three hours of hard climbing the two gentlemen reached the summit; and well they were repaid for their labor, for here reposed like a mighty silver giant, a lode of argentiferous galena from sixty to eighty feet in thickness at that place. This lode the superintendent named the Union Lode. Upon the ground there were hundreds of tons of ore, which probably had been accumulating for centuries; as the surface or the mountain wasted away the lode fell for want of its usual lateral support. Some of the ore was taken to camp and assayed, and found to contain one hundred and seventy-nine dollars per ton of 2000 lbs. Gold was easily traced at the base of the pit or test, but preparation had not been made for the separation of the precious metals, and it was calculated upon the standard value of the inferior metal, silver. Upon actual survey, taking the valley as the base line, it was found that this lode contained above the level of the valley, in the distance of 8100 lineal feet, over 3,000,000 tons of silver ore; and as the silver mines of the northern district prove richer as the miners descend, who then can calculate the value of the mineral in the Union Lode? Urged on with renewed energy the explorers set to work earnestly to prospect the mountain north and south of the Union Lode; the ground south was very much broken; the spurs of the mountain were irregular in their form, and no trace of matrix or mineral could be found; but north of the Union nearly every foot hill presented the croppings of a large quartz lode of silver ore, and in less than thirty days of prospecting the exploring parties were the owners, by discovery, of twenty-two silver mines, the smallest being at least ten feet in thickness. It may be interesting to your readers to explain how these lodes of mineral are taken up, claimed or held, and the character of the laws which govern the possession and working of the same.

Upon the discovery of a new mining district, a meeting of the miners then in the district is called, and laws similar to those of other districts is passed, subject to alteration or amendment only after public notice has been given in the district for three or four months that the alteration is contemplated, the district is then named, a recorder elected, thereby completing the machinery necessary for perfecting the mining title.

The following is the substance of such miners' laws:—Each person or miner is entitled to hold one claim of 300 lineal feet on a lode. The discoverer of a lode is entitled to three hundred feet additional, as a reward for the discovery. A company of two or more persons is entitled to one hundred feet of ground on each side of the lode. Ten days are allowed for marking off, staking or surveying the claims, also for recording the names of the parties taking up said claims. One hundred dollars in money, or ten days of faithful labor must be expended by a company upon a lode within sixty days from the date of recording, otherwise the claim are considered as abandoned, and may be re-located by other parties; but if the work has been done, and the recorder is

satisfied, his certificate to that effect issued to the parties entitles him or them to hold such claims for one year without additional outlay of money or labor.

The are the chief features of the laws by which the mineral interests of this State having been governed ever since 1849, and their efficiency and stability may be attributed to their origin, the "miner," who desired only that protection which he was more willing to afford others. The absence of that quantity of language generally considered so necessary in which to bury the pith or marrow of an intent or law, may account for the successful harmony which these laws have maintained during a period of 12 years amongst a population collected from all parts of the world. The "Book of Records" is absolute authority in all the courts of law in the State, and the evidence contained therein always controls the judgment of a correct court. The specimens marked A are from the "Union Lode." This ore possesses a great advantage over many other "silver ores;" the galena is in such quantity that it becomes what is termed "fire ore," and consequently the precious metal can be obtained in combination with the base metals, without the tedious and expensive process of amalgamation. It is proposed to smelt the ores in this district, run the lead and precious metals contained therein into bars or pigs, and ship them to Europe, where economy will attend the separation. There are at present no melting works in this State of that magnitude which the extent of mineral country lately discovered will require, and a strict investigation into this subject by the capitalists of Europe will surely result in an investment commensurate with the requirements.

There mines are all situated in the range of mountains shown on the map as the "Owen's Mountains," but called by the Indians "Inyo Mountains." These mountains are parallel with the Sierra Nevada Mountains, distant from base to base about 15 miles; only 12 miles east from the base of the Sierras flows the "Owen's River"—a swift stream healthy water when the river is low, but very bad when it is high, as the banks are chiefly alkali, and readily impart their medicinal obnoxious peculiarity to the passing stream. Three miles east of the stream is the base of the mountains containing the mineral above referred to. The sides of the river for 100 miles from the luxuriant growth of grass afford abundant sustenance for thousands of animals. The sides of the Sierra Nevada Mountains are covered with forests of gigantic pine, whilst the Owen's Mountains of the Russ district promise fuel enough for a century or two by forests of Piuyon pine, sugar pine, and mahogany, the latter being so dense as to sink in water like a stone.

The tribe of Indians which inhabit this Owen's Valley is commonly called the "Owen's River Tribe," but their proper name is the "Manache Tribe." They are peaceful, and make with little training good servants; in that capacity the exploring party found them obedient, useful, and intriguing; but naturally great thieves. They are armed with bows and arrows only; their contact with civilized man will soon inspire them with love for the rifle, and then some aggression by their use of it against the white man will doom them to the usual fearful, certain fate of extermination.

A more elaborate description of this mineral country might be given you, but not a more truthful one, and as the development of the several mines advance, you shall receive additional intelligence, and if it serves to instruct or amuse your readers your correspondent will be satisfied.

SAVAGE EXPEDIENT TO OBTAIN WATER.—Livingston, the African traveller, describes an ingenious method by which the Africans obtain water in the desert: The women tie a bunch of grass to one end of a reed about two feet long, and insert it in a hole dug as deep as the arm can reach, then run down the wet sand firmly around it. Applying the mouth to the free end of the reed, they form a vacuum in the grass beneath, in which the water collects, and in a short time rises to the mouth. It will be seen that this simple and truly philosophical and effectual method might have been applied in many cases in different countries where water was much needed, to the salvation of life. It seems wonderful that it should have been now first known in the world, and that it should have been habitually practiced in Africa, probably for centuries. It seems worthy of being particularly noticed, that it may no longer be neglected from ignorance. It may be highly important to travelers in our deserts and prairies, in some parts of which water is known to exist beneath the surface.—*Mountain Messenger.*

A DEEP HOLE.—It is said that the bed of the harbor and Bay of San Francisco, presents most remarkable inequality of surface. Just to the left of the track of the Oakland boats, and about half way from Goat Island to Oakland, it is said there is a hole 700 feet deep, with nearly perpendicular sides and only a few rods in diameter. Of course it can be nothing but the crater of an extinct volcano.—*Pacific Sentinel.*

RANGE OF SOUND.—Paschel gives 345 miles as the greatest known distance to which sound has been carried in the air. This was when the explosion of a volcano at St. Vincent's was heard at Demarara. The cannonading of the battle of Jena was heard in the open fields near Dresden, a distance of 92 miles, and in the casemates of the fortresses it was very distinct. The bombardment of Antwerp in 1752, is said to have been heard in the mines of Saxony, 370 miles distance.—*Trinity Journal.*

TO EMIGRANTS TO MEXICO.

THE UNDERSIGNED BEGS LEAVE TO INFORM THE RESIDENTS OF California that he has been appointed United Agent of Emigration, to act in California, for the State of Sonora, Mexico.

The inducements held out to emigrants intending to become permanent residents in the State of Sonora, are of the most liberal character; the fertility of the soil, the well known richness and extent of the mineral regions, and the salubrity of the climate, render this beautiful country a very desirable region for immigration.

Referring to the laws of the Supreme Government of Mexico, and those of the State of Sonora, published herewith, the undersigned would state that, in addition to the privileges conceded by those laws, he has instructions from the Government to insure to the persons first arriving in Sonora, tracts of beautiful land in the immediate vicinity of the city of Mazatlan.

Full powers and instructions, under the seal of the Government, can be seen at the office of the undersigned, where he will be ready to impart to persons wishing to emigrate full information as to the mineral and agricultural resources of the country, and the great advantages which will accrue from the cultivation of sugar, cotton and tobacco.

ALFRED A. GREEN, Emigrant Commissioner.
Office Union Hotel Building, corner of Merchant and Kearny streets.

(TRANSLATION)

DEPARTMENT OF STATE,
Office of Encouragement of Industry, Commerce and Colonization.

The citizen Benito Juarez, Constitutional President of the United States of Mexico, to all the inhabitants thereof:

I have thought proper to decree the following:

Article 1. Every foreigner who alone, or in company with other foreigners, buys a tract of land for agricultural purposes, or to establish a farm, (finca rustica), shall be exempt for five years—counting from the day on which the papers of purchase were signed—from all taxes or contributions of any kind; being required, however, to present a plan of his possession to the Minister of Colonization, (Fomento), without which he cannot enjoy the aforesaid privilege.

Article 2. Every foreigner, or company of foreigners, who shall buy a tract of land to found a colony, shall, with their colonists, be exempt for two years, counting from the day on which the papers of purchase are signed, which they themselves may impose; but they must present, within a year, the plan and survey of their possessions to the Minister of Encouragement of Colonization (Fomento) under the penalty of losing the privileges granted in this article.

Article 3. The foreigners comprised in the preceding articles shall enjoy, for a further period of five years, all the privileges therein granted to them if, at the expiration of that time, they show that the number of Mexicans employed in their colonies or lands, is not less than one-third part of the entire number of laborers or colonists therein.

Article 4. They shall not pay, for two years, any duty on imported goods, nor internal duties of any description on articles that come consigned for the use of the colony, or for the working of their lands. Should any merchandise coming from Europe, thus introduced for the use of the colonists, be circulated in commerce, it shall be subject to confiscation.

Article 5. All colonies founded in accordance with the preceding articles—the object being to encourage foreign immigration—shall be entitled to dispose freely of the municipal funds which they may produce, and the authorities shall not interfere with the administration of the same.

Article 6. The inhabitants of the colony thus formed—in what belongs to the fulfillment of the privileges conceded by this law, and the privileges mentioned in the Constitution of the Republic—shall, for a period of two years, enjoy the same rights which they would enjoy in their respective nations, or the nation of the owner of the property to which the great number of the colonists belong.

Article 7. All owners of farms (finca rustica) and colonists remain entirely subject to the laws of the country in all the points not explicitly determined in this law, with the reservation of the terms specified in the preceding articles.

Palace of the Federal Government, in Mexico,
March 31, 1861.

BENITO JUAREZ.
To the citizen Ignacio Ramirez, Minister of Colonization, Industry and Commerce.

God and Liberty!
MEXICO, March 13th, 1861.

(TRANSLATION.)

Placido Vega, Constitutional Governor of the State of Sonora, to the inhabitants thereof:

Know: That the State Congress thereof has directed to me the following decree:

No. 30. The people of the State of Sonora, represented by its Congress, decree the following:

Article 1. All public or vacant lands (Los terrenos y aguas validas) and water in Sonora are the property of the State. One half of them are dedicated to protect national and foreign immigration, and to constitute a branch of the public revenue (erario publico).

Article 2. Every immigrant, or company of immigrants coming with capital to settle in Sonora, free of charge, the quantity of land necessary for the colony be or they may establish, with no other expense than that of the survey.

Article 3. All foreign immigration will be exempt from duties and taxes of any kind, and from military service, for five years. Foreign immigrants will, moreover, enjoy the privilege of establishing their own government and municipal legislation, provided they do not oppose the general laws of the State.

Article 4. The Government will issue the most proper and positive orders, so that immigrants will not be molested, or embarrassed by the anticipation of the fiscal laws; and from the time that they enter the State until they arrive at the place where they may establish their residence, and during the term of their residence, they shall be protected and favored by the local authorities, when such favor and protection may be required.

Article 5. The inhabitants of the State who thus cultivate and gather within his property an hundred loads of cotton, of twelve arrobas (300 lbs.) each; one hundred arrobas, (25 lbs. each) of coffee or of sugar, shall receive a bounty of three thousand dollars, to be drawn from the State Treasury, in preference to other demands.

The Government will provide for the most complete execution of this law, and direct that the unoccupied lands (terrenos validos) within the district of Mazatlan be first surveyed.

Communicate this to the Executive for publication and fulfillment.

Hall of Sessions of the Congress of the State,
Mazatlan, 15th January, 1862.

FRANCISCO CORTEZ, Deputado Presidente.

FRANCISCO J. ARAGAN, Deputado pro Secretario.

JOSE VALADES, Deputado pro Secretario.

Wherefore, I order this to be printed, published and circulated for exact observation.
Port of Mazatlan, Jan. 16th, 1862.

PLACIDO VEGA.

[Seal.]

FRANCISCO FERREL.

DR. CHAS. H. TOZER.

WOULD most respectfully inform his friends and acquaintances and those afflicted that he has removed his place of business from the City of Sacramento to San Francisco, where he can be consulted, and where they will receive the best of care and be sure to have a PERFECT CURE.

Charges moderate.

Private consultation without fear of molestation.

Office hours from 9 A. M. to 5 P. M.

Consultation Free, both personal and by letter.

REMOVAL OF THE DEAD FROM YERBA BUENA CEMETERY.

As the dead in Yerba Buena Cemetery will be removed in a short time by the authorities, those having relatives or friends they wish disinterred, are informed that I have the most complete registry in existence of graves in that cemetery, having added to my own records by purchase, the books of the late city sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges. Everything requisite for funerals supplied at the shortest notice.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miners Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3d. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer; together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notices of the processes of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

A BOOK FOR THE MINER.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor the "Mining and Scientific Press" of San Francisco. The title of the work the Miner's Companion and Guide, and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press" for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout our mining towns for its merits and usefulness. We earnestly commend it to those who are practically interested in bringing to light from Mother Earth the treasures of its hidden treasures.—[Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual loss was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., almost two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths fine.....3cts per oz.
" from 300-1000ths to 750-1000ths fine, 7cts " "
" " 750-1000ths to 950-1000ths " 14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARS SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California. By recent additions to our extensive establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp-mills and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness, making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamator, with the latest improvements; Howland & Hanscom's Amalgamator; Goddard's Tub, lately improved, in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Air Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GO DDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogden & Wilson, }

SPECIAL NOTICE.

Highly Important Invention in Dentistry.—Dr. D. STEINBERG begs leave to announce to the citizens of this city, that letters patent for his valuable improvements in mechanical Dentistry were granted him on the 12th of November last.

This invention consists in the application of GEM ENAMEL to gold plates for artificial teeth, and are acknowledged to surpass all others in use, for their beauty, style and exactitude of fit; their weight compared with others, is less but are far more durable by the addition of the gem enamel. Specimens of this valuable invention may be seen and examined at the dental office of the undersigned, No. 618 Washington street, near Kearny. Great care and attention is devoted to the perfect fitting of teeth. Teeth extracted by the benumbing process.

STEINBERG & Sichel,
Practical Dentists,
618 Washington st., near Kearny.

FOR SALE.

TEN DOLLAR LOTS; also 50-Vina Lots, and entire blocks of beautiful Garden land, on the line of the San Jose Railroad, at the West End Depot. Title perfect,—being held under a patent from the United States. Office No. 19, third floor of Nagle's Building, at the southwest corner of Merchant and Montgomery streets.

San Francisco Jan. 27, 1862.

HARVEY S. BROWN.
Feb 5.

W. BOHM'S BUCKLE INVENTION.

I desire to call the attention of the public to my late invention in the construction of

A NEW STYLE OF LADIES' BUCKLES,

for which I have applied for Letters Patent. It is by far the most beautiful ornament now in existence. In the MINING AND SCIENTIFIC PRESS a full description appeared. Messrs. Bravermann & Levy, 621 Washington street, have a complete assortment of all shapes and embellishments. Their cost is no more than the old style, and their simplicity and ease of adjustment considerably enhances their value. (Go and examine them!)

Bravermann & Levy,
621 Washington street, for W. Bohm.

DEVOE & CO.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, at prices as low as sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

H. T. GRAVES.

A. S. HALLIDIE & CO.,
WIRE SUSPENSION BRIDGE BUILDERS,
and Manufacturers of
PATENT WIRE ROPE.

WIRE Suspension Bridges of any span and capacity erected, and material furnished.

Having been constantly engaged in the erection of Wire Suspension Bridges and Aqueducts for some years past, we are fully prepared to do such work satisfactorily at a low figure, and to guarantee PERMANENCY.

Parties who are about erecting bridges will find it greatly to their advantage to give us a call before deciding to build wooden structures, as the recent floods throughout the State have proven them to be wholly unsafe and unreliable. A number of our wire suspensions are now in use in different localities throughout the State, no one of which has been in the least affected by the freshets.

WIRE ROPE, for mining and ferry purposes, manufactured of any length and size required, being cheaper and better than hemp.

Scales of weights and strength with prices, furnished on application to the manufacturers. Send for a circular.

ROYAL HOTEL.
VICTORIA, V. I.

JAMES WILCOX **PROPRIETOR.**

THE ABOVE HOTEL is conducted on the most improved principles; is situated on Wharf street; of easy access to all new arrivals, being in the immediate neighborhood of all the wharves. The proprietor begs to inform the miners of California and traveling public, who intend to visit Victoria, that he has superior accommodations for single and married persons, or families, with or without board.
 Guests entertained at the following rates: Board per week six dollars. Board and Lodgings, \$8; Board per day, \$1; Lodgings 60 cents. The Bar is furnished with Wines, Spirits, Malt Liquors, Cigars &c., all of the best quality.
 N. B.—The Building is Fireproof.

Jan 30

Messrs. Lockwood & Ewell beg to inform their patrons and the public generally that they have constantly on hand a large and well assorted stock of gents' and boys' furnishing goods, and their facilities for disposing of such, on easy and accommodating terms, are equal, if not superior, to any other fashionable establishment in this city. Gents desiring clothing of any kind made to order, will do well to give them a call at their new place of business, situated on the corner of Merchant and Montgomery streets.

Homesteads Cheaper than Proposed under the Shafter Bill.

UNDER THE PROVISIONS of what is known as the Shafter Bill, it is proposed to sell the city title to homestead lots for twenty-five to two hundred dollars each.

The undersigned will sell homestead lots within the limits of the city, and miles nearer to the business centre than many of the lands covered by the Shafter Bill, and place the party in immediate possession of the same, without present trouble or prospective lawsuits, for from \$10 to \$20 each. THE TITLE is absolutely PERFECT, being a Spanish Grant, finally confirmed and patented by the United States. The Shafter Bill respects this title: the city authorities respect it: the District Court and the Supreme Court of the State, as well as the District Court and Supreme Court of the United States respect it: besides the TITLE HAS BEEN FOREVER QUINTED BY A FINAL DECREE AND JUDGMENT AGAINST THE CITY so that there is not even a cloud or shadow upon it. Whoever purchases one of these lots will buy a lot, not a lawsuit.

WHILE YOU HAVE THE MONEY,
MAKE SURE OF A HOME!

NEVER HAZARD THE LAST DOLLAR!

To Cariboo and Salmon River Miners, and all others who wish to purchase LOTS in San Francisco with a PERFECT TITLE:

The undersigned will sell Building Lots for from \$10 to \$200. Also, 50-acre Lots and entire Blocks of the most beautiful gardening lands in the city and county of San Francisco, on the line of and at the WEST-END DEPOT OF THE SAN FRANCISCO AND SAN JOSE RAILROAD. Persons desiring to invest a few dollars, or hundreds, or thousands of dollars, would do well to call on the undersigned, as he deals ONLY IN LANDS WITH A PERFECT TITLE, to wit: those held under

A PATENT OF THE UNITED STATES!

Persons residing in the interior, or who are about to go to the Cariboo or Salmon River Mines, can purchase this property and leave it without any fear of adverse claims or titles springing up in their absence.

The undersigned will, if desired, give his personal attention to the assessing, paying of taxes, etc., on all lots purchased from him, and will forward to each non-resident purchaser his tax receipts, free of all cost save the actual amount of the taxes.

 m8-1f **HARVEY S. BROWN.**

Woodworth & Brown's
CELEBRATED PIANOS.

THE UNDERSIGNED HAS JUST RECEIVED twelve Pianos from the above celebrated firm.

Many years' experience have convinced me that these Pianos have no superior, in Europe or America, in regard to tone, touch or durability; and I can bring sufficient proof of this, by parties in this city, having used Woodworth & Brown's pianos for the last ten years, and will testify that these pianos still retain their original tone and touch.

Mr. Chickering, of Boston, was himself the assigner of the Diploma, giving Messrs. Woodward & Brown the First Premium at the Massachusetts State Fair.

I have specimens on exhibition at the Art Gallery of Messrs. HAMILTON & LOVERING, Montgomery street, between Sacramento and California streets, where purchasers can buy a First Class Instrument, for a little more than New York cost.

I invite those wishing to have a superior piano, to examine the same before purchasing elsewhere.

REMEMBER!—HAMILTON & LOVERING'S Art Gallery, Montgomery street, between Sacramento and California.

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. V.

SAN FRANCISCO, WEDNESDAY, APRIL 9, 1862.

NO. 5.

We give herewith a detailed map from the official surveys by the Mexican Government, who have recently sent a Commissioner of emigration to this State.

The inducements offered by that Government are sufficiently inducive for a very large emigration. Mr. Green, the Commissioner, recently gave a lecture on Mexico, which shed some new light upon the immense wealth and natural resources contained therein, requiring an Anglo-saxon population to develop. The many obstacles heretofore precluding peaceable settlers from that country, have been entirely overcome, since the liberal political party have gained the ascendancy they are indeed liberal; and their laws are far better executed, with justice and equity, besides ample means for protection to life and property. Their laws respecting Real Estate and Mining Property are not perplexing as ours are in this State, hence there can be but little litigation. The agricultural lands are proverbially of the richest nature and its mineral wealth is unbounded. Humboldt's works speak in the highest terms of this. A man with moderate means settling now, must become wealthy very soon.

THE FRENCH IRON TRADE.—Accounts from St. Dizier states that the only sale of cast-iron quoted there for some days past is one lot of 50,000 kilogrammes at 132 f. 50 c., for delivery at the railways terminus near the furnace. The general price asked by ironmasters at St. Dizier is 135 f. It is expected that this price will be maintained for at least three months, until the ironmasters shall find they have an over-abundant stock on hand. At Rouen and at Mulhouse business was almost at a standstill.

At Paris metals have regained a little importance. English copper is quoted at 267 frs. 50 c.; Banca tin at 322 frs. 50c.; French and Spanish lead in pigs at 54 frs. 50 c.; and zinc from Silesia at 46 frs. 50 c.

Title to Mr. Brown's Real Estate.

In reply to the numerous letters we have received making inquiry as to the location and quality of Harvey & Brown's lots advertised in our paper and as to whether the title is good or bad we will say that we have taken the trouble to go and look at them; especially the \$100, and \$200 lots. They are situated upon and near the line of the San Jose Rail Road (which is now being rapidly graded,) and in one of the prettiest if not the prettiest valleys in the city and county. The \$100 lots are 40 feet by 200 feet; the \$200 lots are 80 feet by 237 feet. We have also enquired of some of our ablest lawyers, and have also been to the Recorder's office and find that the title is really perfect. It is an old Spanish grant, confirmed, and patented by the U. S. to Carmen Librian de Bernal and Jose Jesus Bernal. This patent is recorded in Book No. 1, of Patents. Mr. Brown purchased directly from Patentees. As to the inquiry contained in some of the communications "Do you advise me to buy?" we would say that we very much dislike to advise, but candor compels us to reply that we do not believe a man could make any better investment here or elsewhere.

It is but proper also to add that Mr. Brown sustains a high character for honor and probity and has altogether too much to lose to engage in anything that would bring his good name into disrepute.

Map of the State of Sinaloa, Mexico.

Eureka Correspondence.

EUREKA NORTH, March 18, 1862.

MR. EDITOR: For the last ten or twelve days it has been snowing and blowing more or less every day; and while I am writing the depth of the snow, on a level, must be at least five feet; whilst at the head of the ditches which is "poco mas arriba," it is from twelve to twenty feet. There is no water in either of the ditches yet, to speak of. Fisk & Co. have probably seventy-five inches.

The boys seem to be somewhat anxious now to pitch into the howels of Mother Earth, as this is about the time to commence harvesting. A rain storm is now looked for to start the water, in order to start the boys; after which you may expect to hear of some big strikes. The tunnel claims in Mugginsville are paying, as usual, good wages. The Red Jacket, I understand, is paying better dividends now than it has for many months previous, notwithstanding the rich slice that was taken from her by the Chapparral Co.

As yesterday was the 17th of March, peace and harmony prevailed; and it is a remarkable fact, but one man (up to a late hour in the night) could be seen under the influence of lightning and being hard up for spondulies, he was compelled to soak his gum hoots. The ceremonies closed with a most

magnificent ball at the hall of Judge Davison.

The dancing school is progressing as usual, and the ladies sometimes turn out *en masse*.

One of our townies whose proclivities are known to be sound on the bear and renard question, had the good fortune to entrap a very pretty young female of the last named species, near the Kimbal saw mill, about two weeks since; and as it was the first one of the season he seemed to be as well pleased as a school-boy would with a hoop or top. On arriving at the Hotel he collared and chained it, and was determined on raising a pet; but on the following morning, lo and behold! it was found that the little cuss had run the blockade by seceding to the mountains, much to the disgust of his master.

Occasionally you will hear the merits of Salmon and Cariboo discussed, by floating miners. Several of our citizens who have been rusticated at the metropolis during the last three months have returned, and amongst the number are Messrs. Brown, Bliss, Mead, and others—including John D. Hendry, who, like a sensible man, brought with him a better half, whom he found and took unto him a few days since at the Bay City.—Edw.

Rip.

SUMMARY OF MINING NEWS.

To Miners and Mill Owners.

We respectfully request all persons interested in the Mines, in Quartz Mills, or in any prospecting expedition; also the Recorders of the different mining districts to forward to us at all times, such information concerning the condition etc., of the mines and hills in their vicinity, and description of localities, as they may think will prove interesting or useful to the public, for publication. Recorders of mining districts will oblige by sending us their address.

NEVADA TERRITORY—MINING SUMMARY.

Latest accounts from Washoe authorize the most flattering anticipations with regard to the prospective yield of treasure. So much is said at random concerning such matters that it is not always easy to frame an idea in advance, but we have no reason for doubting the opinion of the "Territorial Enterprise," that the amount of capital invested in Washoe stocks the coming summer will exceed that of any former season, with more caution exhibited in the investment. The rapid development of these mines is retarded by the unwillingness of capitalists to advance means until the claims in which they are asked to invest are fully developed. This backwardness has proved the stumbling block to many a poor Nevada's dreams of fortune.

COMPARATIVE VALUE OF TREASURE.

From the most reliable authority within its reach, the "Silver Age" learns that Gold Hill bars run from 40 to 86 per cent. gold, making an average of 63 per cent. gold. Ophir and Spanish leads—the poorest in gold of any in the Territory—pay 30 per cent. in that mineral. The Ophir Company expect, as soon as they can get all their machinery at work, to turn out \$40,000 per week—\$2,080,000 per year. Assessing the Gould & Curry at \$1,500,000, and the Spanish at \$1,000,000, and we have an aggregate yield from these three claims of \$4,580,000. Gold Hill has heretofore, and in all probability will continue to pay larger than these three claims together. The entire yield of the Territory for the year to come is estimated at \$10,000,000, of which \$5,000,000 will be gold. Esmeralda and Humboldt are likewise paying an equal or greater percentage of gold than Gold Hill.—These statistics are cited by the "Age" to prove the necessity for a mint in Nevada Territory.

We find the following pleasant item of news relating to a neighbor, in the Nevada "Transcript":

"Mr. Wm. Nichols, an old resident of Columbia Hill, arrived in town yesterday from San Francisco, where he had just sold out his interest in certain mining ground in Nevada Territory, for the snug sum of \$120,000. Mr. Nichols, tired of Columbia Hill, had gone to the land of silver some months since, and he made good use of his time while there, as the sale above mentioned bears witness to. He brought with him from San Francisco an elegant establishment in the shape of a fine light carriage, to which were hitched as pretty a span of trotters as we have seen in many a day. One of them, in particular—a 2:40 mare—is a fine specimen of horse flesh. Mr. Nichols paid \$700 for her alone. It is better to be born lucky than rich. Long may he live to enjoy his wealth!"

Long may he flourish! say we.

From Esmeralda.

We take the following extracts from a letter in the "Silver Age," dated Aurora, March 15th.

A new ledge was found the other day called the Real Mena; (mine) it is thirteen feet wide and is very much decomposed, and it is supposed will yield one hundred dollars and upwards, per ton. It is on Martinez Hill, about four hundred feet west of the Horatio, and four hundred feet north of the rich Juniata lode. There are two Garabaldi companies the one is called No. 1, the other No. 2, and the shaft is sunk on the dividing line so that no difference exists in the value of the same amount in either. No. 1 has segregated their claim. The Golden Age and the Empire lodes were supposed for some time back, to run into each other, but the companies have stripped their veins and find them entirely separate and distinct ledges. They are both good ledges and are held high.

The Polar Star Co., have completed their contract of a sixty foot shaft, and have a four foot rich vein.

The Long Island Co., are getting out rich rock, similar in its character, and is supposed to be the north extension of the Antelope.

The Antelope Co., have out, now, nearly two hundred tons of rock, and it will pay immensely well.

The Utah Co., are getting very rich rock, and have a good vein. They have about one hundred tons now out, which will pay on the average nearly one hundred dollars per ton in gold and silver.

The St. Louis Co., have shoveled away some ten feet in depth of snow, and resumed their work. They have a fine

ledge, and it is held as the third in the district in value.

The Live Yankee Co., have their tunnel in to the vein. The rock is rich.

The Bright Star Co., have a large quantity of very valuable rock at the mouth of their incline shaft.

The Julian Co., are also getting out very rich rock, and many others have the most flattering prospects. In fact, it will puzzle a quartz miner to find a better place than this to operate with a certainty of reaping a rich reward for his labors.

A shooting affray took place last Sunday eve by way of a change, in our usual quiet routine. A Mr. Cheek shot Jo. Melvin in both legs, flesh wounds, not serious. The difficulty is supposed to have all three great causes of murderous attempts connected with it, namely: money, wine and woman.

Some very rich rock was shown to me to-day from the Walker river district, thirty miles northerly from here. The Bright Star Co. and the Galena Co. there, have the two mills crushing their rock to day. The Durant mill is working the Bright Star and the Worland is crushing the Galena Co's rock. They anticipate a yield of forty dollars per ton in gold. This will give the owners of the veins a very good profit, as the rock is easily taken out and handy to the mills which crush cheap having good water power.

A fine vein of bituminous coal is believed to exist near this place on the Walker river, and parties are prospecting the vein. The coal burns, and has that "infernal" smell if water is thrown on it while hot.

We clip from the "Silver Age" the following important items which are worthy of interest:

NEW STRIKE.—A Dayton correspondent informs us that there was a great excitement at Spring Valley, about two and a half miles west of Dayton, on the 19th, in consequence of recent rich discoveries said to have been made in the "Nip and Tuck" Company's lead. It is supposed to be an extension of the Dana, and equally as rich.

GOLD HILL ROAD.—With the exception of about one mile of the grade near Gold Hill, the road from here to that place is in excellent condition. The Commissioners of Storey county have passed an order to have this part of the road macadamized to the width of twenty feet; but where and when they can raise the means or rid themselves of the prior right of the toll road company, we are not informed. One thing is certain, however, that road ought to be macadamized, or a railroad substituted in its stead immediately.

THE NEW EXCITEMENT.—There is no longer any doubt of the fact that several very rich quartz lodes have been struck near the Silver City road and about a mile beyond the New York House. The first and best so far, is the Columbia. The shaft is down on it about thirty feet, and the owners are having some of the rock crushed at Owsley's mill, which produces equal to any Gold Hill rock. The lode is about twelve feet wide and very much decomposed. Just below this at a distance of about three hundred yards, in the Winemucca, the shaft on which passed through quartz. As the lode dips to the westward, the workmen are working back toward it. Still below this, on the east side of the road, is the Robin Hood, which has an incline down about fifty feet, and have a large amount of pay rock already out and ready for the mill. This is also a valuable lode. The Lady Washington, further south on the Dayton road, is very rich so far as opened. Besides these, several other strikes have been made in that neighborhood.

A correspondent says, I desire to state through the "Age" that the road from here to Esmeralda is now in reasonably good order, and growing better very rapidly. The bridges that were washed away on the river during the great floods are being replaced, and in a short time everything on the road will be in complete order.

New and astonishingly rich discoveries are being made daily at Aurora, and the old ledges are being worked with vigor. The only thing they now need in that locality is to have mills erected, and "scads" will be plenty.

A late prospecting company brought in just before I left Aurora on Monday last some very rich specimens of ore. All now seem as busy as bees.

The "Julia Ann" Company are taking out very rich rock. They are down twenty-eight feet, and have thirty tons ready to crush. It will, it is thought, yield very rich. I do not speak of this in comparison with others, but only to show that late discoveries are as rich as the old ones, and that the ground is not all taken up yet. Truly yours, Carson, March 20, 1862. H. W. BAGLEY.

THE MILLS.—Paul's lower mill at Silver City is being thoroughly repaired, having new boilers and stack pipe, with many other improvements. A few other mills are standing idle for repairs and for want of quartz, but most of them are running full time. A number on the river and at Dayton are also running. Atkinson & Co., at Empire, have not yet repaired their dam and flume; but will probably be ready to run by the time the roads are in good condition.

It is currently reported that Mr. James Morgan has sold his one-third interest in the Stewart & Henning quartz mill, for the sum of thirty-five thousand dollars. We believe that the entire property has changed hands. Col. Raymond is the reputed purchaser of Mr. Morgan's interest.

FROM AURORA.—A correspondent writing from Aurora, March 15th, says:

Rich placer diggings have been discovered near Owens Lake, about one hundred miles below this place. A large number of persons have left this vicinity for the new mines. The authority is very reliable.

Mr. Melvin, who was shot by Mr. Chick, last week, will recover.

Mr. P. P. Moses' improved quartz mill has been started, and is a complete success. It eclipses all the other modes of quartz crushing yet discovered. The machine, at first sight, reminds one of a "corn sheller." It will grind twenty tons per day, and that, too, as fine as "fiddle dust." The machine was shipped from Cleveland, Ohio, at which place the owner experimented on lake shore boulders, which are said to be harder than any quartz ever discovered; yet they yielded to the powerful machine as if they were composed of chalk. In short, it is well calculated to completely revolutionize all other modes of crushing. Yours, B.

FROM THE HUMBOLDT.—On Thursday last, our friend, W. J. West, arrived at his residence on Ink's Creek, direct from the Humboldt mines, where he had been for several months past. He was in town yesterday, and informs us that he is interested in several of the best claims there, and gives a very flattering account of the prospect in that country. He is surprised at the rush for Nez Peres when a better thing can be found much nearer. He says there will be two or three mills in operation within the next six weeks, and after that there will be no difficulty in telling who is rich and who is not. He represents the National lead as almost fabulous in wealth. This is a gold lead, and turns out from fifteen hundred to five thousand dollars to the ton. Shares in it cannot be got at any price. Our old acquaintance, Henry Sadorus, of Butte, has his length (six feet) in it, and considers himself a wealthy man in consequence. Mr. West met Mr. Judson at Smoke creek, about half-way between Honey Lake and the Humboldt, and Judge Harrison at Susanville. Mr. W. was nine days coming from Honey Lake to his residence, and was two days without anything to eat. He says almost the entire trade of the Humboldt mines can be concentrated at Red Bluff, if the people in this section will finish the road south of the Lassen Buttes to Susanville. Mr. W. expects to return before a great while. The citizens of this town hold her destiny in their hands, and if they expect to build up a city, this golden opportunity must not be allowed to slide through her fingers now.—Red Bluff Beacon

HUMBOLDT.—Mr. Steve. Falls, of this city, returned from Unionville on Tuesday evening, and states that the miners in that region were in good health and spirits, confident that they have a mineral region second to none yet discovered. The National Company had sunk a shaft about 40 feet, and drifted 20 feet each way on the lode. They had taken out about 60 tons of very rich gold-bearing quartz. The Alba Nueva had their tunnel in about 175 feet with a connecting shaft 65 feet deep. The Bonny Belle's tunnel was in 130 feet; the Peru was in 75 feet, and the Rising Sun Company were running day and night. The only great drawback which the miners have to contend with is the want of quartz mills, for they certainly have the rich rock in abundance. Mr. F. also states that in most instances of reported stock killing by the Indians, it is done by white men, who are seeking to make money, and at the same time lay the blame on the Indians. These men also change the brands and otherwise rob men of their stock, and then join in the cry against the "thieving Indians." Stock-owners ought to employ honest men to go down and watch for these chaps and if possible, treat them to a little powder and shot; it would be none to good for them. The roads were in good condition generally, and the snow at the summit of Humboldt mountain was not deep enough to interfere with travel.—Age.

South Sierra, considering the dullness complained of, is yielding a very creditable quota to the gold shipment. Heintzen is doing a brisk business in Forest City, and Stillwell in Alleghany—buying, melting and assaying gold. The former melted, one day last week, from the purchases of two days, 60 lbs.

At Forest City the Uncle Sam Co. has again lit upon a rich pay streak of auriferous gravel, which yields largely. Took out 70 ounces last week, the product of five drifters. Live Yankee Co., paying a little over expense. Dutch Co's claims—submerged by the floods of January—freed of water, and about ready to resume operations.

Fremont Co. at Wet Ravine, doing unusually well. Highland & Masonic Co. has out a large lot of pay dirt which it is thought will yield at least \$20,000 as soon as water can be had for washing.

Claims of the Excelsior, Red Star, Union and other companies, at Cumberland, turning out better than at any other point in this part of the county. Week before last, the first named company divided \$200 to the share.

The tunnel of Wright, Madden and others, which is intended to tap a ledge of gold-bearing quartz, situated between the forks of Kanaka creek, at a depth of 130 feet, is about completed. The stockholders are confident of striking a "big thing," as they have taken rock from the vein 30 feet below the surface which prospected as high as 8 cents to the pound.

At Rock Creek, the Extension and Forest Coe. are taking out good pay. The latter company, on Monday last, brought to light a handsome chunk of pure gold weighing 16 ounces.—Sierra Dem.

OREGON MINES.

An able cotemporary the "Republican" of Eugene City, grows quite peadrous over the expected rush to the mines in its vicinity. We admit that the rush may be tremendous thither, but it will be incalculable to estimate the sudden return of the wo bestreckeru—dubed—men. The author however "draws it mildly" by ndvising those having farms or other paying occupation to remain at home, ho remarks:

We are pleased to see a landable degree of interpriso manife-ted by our populace, but we greatly fear that in the matter of mining enterprise the thing will be a little "over did" this Spring. Many men who are well situated to do a handsome business at home are making haste to go to Salmon, without securing tenants for their farms, and some without even leaving their ground seeded. This, we think, is a great error, both in a general and in a particular point of view. It will be the worse for the country, which will be scree of provisions and feed next winter at best, and it will be the worse for the individual who could realise a handsome profit from his crop. It is not safe to calculate that more than one man out of every three or four who goes to the mines will make it pay well, say even as well as they might do at home on their farms. Now it would be far better for the men who will ramble around over the mining region, prospecting, and probably making about expenses—some not doing so well—were they at their homes, making plenty of bread and meat for themselves and for sale to those who do make it pay. We would not discourage those who are prepared to go and leave things in a proper condition at home from going, for we helieve the prospects are good, but we would urge all who have farms to see to it that their land is planted before they go.

Scientific Notes, etc.

ASSAY OF SALMON GOLD DUST.—We have before us a certificate from the Branch Mint of the U. S. of the assay of 350.57 ounces of Salmon gold dust for Mr. Jacob Wiser. After melting the weight was 833.38 ounces; fineness 681, value of the gold \$4,692.87; fineness of the silver, 313, value of the silver, \$131.94; premium on the silver, \$520; deduction for parting, coinage and fine bars, \$47.47; net value, \$4,782.62, or \$13.64 per ounce of the merchantil dust.

A TELEGRAPHIC CABLE.—Wm. P. Piggott, of London, an eminent medical electrician, has invented a cable for ocean telegraphing the peculiarity of which is that, instead of requiring an enormous electric charge to be forced through the whole length of a line by powerful batteries, at each successive transmission of a signal, as at present, in a long sea and land routes, the wire continues statically charged as it is laid, whilst the least disturbance of the equilibrium of this passive electric charge, imperative and influenced until called into action by the operator, answers through all its length to the slightest transmitted influence, and so serves every practical purpose.

HUMBOLDT QUARTZ.—Mr. Rollins, who has resided at Unionville since August last, left at this office yesterday, several specimens of very rich gold and silver bearing quartz, principally from the National, Alba Nueva and Rising Sun ledges in Buena Vista District. Most of these specimens show free gold in abundance and prospects well in silver. There are six ledges in the district which are almost exclusively gold bearing, while the others are more of the silver bearing quality. Thirteen tunnels are now being run into the hills and six more have been commenced. Over one hundred and fifty ledges have been located in the district, and new strikes are being made almost every week. Water privileges have been taken up on the Buena Vista Creek for a distance of four miles—also in Coyote and Star Cañons north of Unionville. No mills have yet arrived, but men of capital have bought mill sites with a view of erecting mills at an early day. In all of the ten districts of that region, the miners are busily at work, but none have succeeded so well in opening their claims as the miners in Buena Vista. Humboldt City undoubtedly has more accommodations than Unionville, but the mines in that vicinity were not so well developed as at the last named place. Late discoveries had been made to the northward of the Humboldt mines which were very promising.—*Silver Age*.

SIERRA QUARTZ.—The Sierra Buttes Company cleaned up, last week, for 42 days run of one mill only, \$20,500.

Wood & Beattie retorted \$5,700, for a 28 days run of one mill.

Primrose Company, after a run interrupted for repairs, had \$4,500.

The Spring time must be coming. Eight gentle Annies have arrived in town this week, and are holding levees at Kalser's hurdy house.—*Sierra Democrat*.

CANAL GULCH.—The miners at this place are doing extremely well lately, and the whole gulch is as good for mining advantageously as when first touched, on account of the immense amount of tailings being sluiced off by the winter freshets.—*Yreka Journal*.

State Geological Survey.

We give herewith a short synopsis of the plan proposed by Professor Whitney, for conducting the Survey. He has addressed a letter to this effect to the Governor and the execution thereof will materially depend upon the amount to be appropriated by the Legislature. That we require this Survey there can be no doubt, or an objection raised, but if we are to take into consideration the retrenchment disposition prevalent throughout the official and legislative bodies in the country we entertain fears of its accomplishment. Thus far however the board constituting the Survey, have been diligently employed in writing up their notes, and are now preparing their annual report which will be recommended to be printed.

TOPOGRAPHY.

A series of maps has been commenced on a scale of half an inch to a mile extending over the region visited by us up to this time. These maps are now thirty-two in number. On them we have in the first place collected all the information obtained at the Surveyor-General's office, the archives of which have been liberally placed at our disposal for this purpose by Mr. Mandeville, the former, and Lieutenant Beale, the present Surveyor-General. I desire also especially to mention the kindness of Mr. Bielawski, the chief Draughtsman of that office, in aiding our work; with this basis Mr. Hoffman has filed in the Topography over a considerable area, by triangulating. Compass bearings have been taken from all elevated points ascended by any of the party. Observations for latitude and longitude have also been made at numerous points. The vast importance of the Geographical portion of our work has been every day becoming more evident to us. A large part of the State can only be represented, at present, on the map, in the crudest and most imperfect manner, and it will be absolutely necessary for us to devote a considerable portion of our time and money to the Topographical work, in order to be able to furnish a map on which the Geology of the State can be laid down, even approximately.

PHYSICAL GEOGRAPHY.

Barometrical observations have been constantly kept up during the progress of the field work, and the data obtained for the determination of the elevation of about one hundred and fifty important points. All facts which have come under our notice bearing on the Climatology of the Pacific coast, have been noted. The subject of the Topographical and Geographical work of the Survey will form a separate paper, which will be submitted to the Executive, to be laid before the Legislature, as soon as it can be prepared. In that paper it will be my aim to show what the State absolutely requires in this department; what may be accomplished in it by the Geological Survey, and what amount of money will be required for this purpose.

GENERAL GEOLOGY AND PALEONTOLOGY.

The main business of the Survey has been, of course, the development of the Geological structure of the State. The rocks have been carefully examined, their lithological studied, fossils collected, and all indications of useful ores and minerals which they have been found to contain carefully noted. The area over which our observations have been extended, in the Coast Ranges, is about four hundred and eighty miles long, by fifty broad, or twenty-four thousand square miles, a territory about half the size of the State of New York. Of course it is not claimed that anything more than a general reconnaissance of so extensive a region could have been made in so short a time by one party; but, as far as possible, important points have been carefully examined, and especially those where valuable deposits of mineral substances were reported to exist.

ECONOMICAL GEOLOGY.

The region examined by us during the present year, in the Coast Ranges, is not by any means as rich in metaliferous ores as some portions of the Sierra Nevada. The deposits of mercurial ores, however, are numerous and important, and some of them are extensively worked, and supply a large portion of the world with this metal. There are also very heavy beds of chromic iron in this geological position, which will eventually be of considerable value. Coal is another important product of the Coast Ranges, from which the wants of the State in this indispensable mineral will be ere long supplied to a considerable extent. Limestone is abundant, both in the metamorphic and the unaltered strata, and some beds of hydraulic limestone have also been discovered.

Most of the important quartz gold mines of the State have been visited by Mr. Ashburner, and a large amount of information collected by him, preparatory to an elaborate investigation of this important branch of the industry of California. Sufficient time was spent at Wnshoe, by Mr. Ashburner and myself, to gain a general idea of the character and value of this important and interesting mining district, in which this State is so largely interested.

BOTANY AND AGRICULTURAL GEOLOGY.

The Botanical collections made by Professor Brewer, are already quite extensive, comprising nearly one thousand species of plants, of each of which numerous duplicates were preserved. A beginning has been made in the agricultural department, to which, during the coming year, a larger part of the time and attention of the Survey will be given, provided the means are furnished by the State.

ZOOLOGY.

During the winter and spring of eighteen hundred and sixty, sixty-one, Dr. J. G. Cooper, Surgeon United States Army, who was stationed at Fort Mohave, made collections in all departments of Zoology for the Survey. In July last, at the earnest recommendation of the Smithsonian Institute, this gentleman, who had been previously attached to one of the Pacific Railroad expeditions as Naturalist, and who is one of the authors of an elaborate work on the Natural History of Washington Territory, was placed in charge of the Zoological department of the Survey. He has since that time been engaged at various points on the coast, between San Francisco and San Diego, in collecting marine and land animals, and has made interesting discoveries touching the distribution of animal life on our coast. He will remain at San Diego during the winter, for the prosecution of these investigations.

COLLECTIONS AND STATE MUSEUM.

The collections made by the Survey up to this time occupy about one hundred and twenty boxes, comprising zoological and botanical specimens, rocks, fossils, ores and metals, all of which are of interest as illustrating the natural history, the geological structure, and the mineral resources of the State. The boxes will be unpacked during the winter and more or less completely examined and arranged. My ideas and plans, in regard to the establishment of a State Museum, have been already laid before you. They have also been submitted to several distinguished scientific men in this and the Eastern States, and have met with general approval. If the necessary amount of money can be raised to carry out these plans, California will, in a few years, be possessed of a State Museum which will be of the highest value as a means of education, and will be the depository of specimens of all that is scientifically interesting or economically valuable on the Pacific coast. Owing to the peculiar condition of the country at present, I am not disposed to press this matter; but the importance of securing our valuable collections from loss by fire, and of placing them where they will be available, will make it necessary that the consideration of this subject should not be deferred more than a year or two at the outside.

LABORATORY AND CHEMICAL WORK.

Owing to the press of other work, and the expense necessary to be incurred, no fully-equipped laboratory has been prepared, and no assistant, exclusively devoted to this branch, engaged. Numerous qualitative examinations have, however, been made, as well as a few quantitative ones, while a large number of specimens have been examined, and information given concerning them to private parties at the office of the Survey. We have been always willing to advise persons desirous of engaging in mining operations, or to give information in regard to metallurgic processes.

As the asphaltum of the southern counties is an abundant product, and one which has, as yet, been made but little available in an economical point of view, compared with what it may be, the whole subject of its chemical composition, and the best method of applying it to use in the arts, or of obtaining oil, gas, or other valuable products from it, has been referred to F. H. Storer, of Boston, for a detailed report. This gentleman is, undoubtedly, better qualified than any one else in the United States, to give this difficult matter a thorough investigation.

I am, with high respect,
Your obedient servant,

J. D. WHITNEY,
State Geologist.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

WEDNESDAY.....APRIL 9, 1862

The MINING AND SCIENTIFIC PRESS is published at the State Capitol building, Rooms 23 and 24, corner of Battery and Washington streets San Francisco, Cal., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING. Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

To Our Representatives at Washington.

We are much obliged to Senator Morrill of several southern counties, for introducing a concurrent resolution in both houses for an important acquisition, most needful to our mechanics, artisans, discoverers, inventors and scientific men generally, which asks of our able Representatives at Washington, that they obtain the publication of all Patents issued from the Patent Office at Washington.

We say it is most needful from the fact, that inventors in the Pacific States, have never had facilities extended to them, like the residents of their sister States. When an inventor here, sends his petition to the Commissioner for a patent, he has often been anticipated by others near Washington, and thus the poor inventor loses \$15—the fee accompanying his papers to say nothing of the incidental expenses such as models, solicitors fees, postage, and the loss of time,—which in many cases reach from \$75 to \$100.

This Resolution has been introduced at the instigation of the Editor of this journal, who has observed that this evil works detrimentally to our inventors and our Representatives are thus earnestly solicited to use all diligence in obtaining this boon for the Pacific States. This journal has ever been foremost in advancing the interest of our inventors, discoverers, mechanics and manufacturers and it is therefore presumed that such publications come directly within our sphere. The Resolution asks that the same be published in some Scientific publication.

Our Foundries and Machine Works.

We visited recently all the Foundries and Machine Works and find them all in a thriving condition—immense preparations for the construction of mining machinery are being made, and the season will prove one of the most propitious for this branch ever experienced, in this State.

Several of the Establishments have enlarged their premises and have added more facilities for doing work. Messrs. Goddard & Co. have now under way a new amalgamator, of which we will soon present an illustration; it presents an entire new feature in the reduction of ores indigenous to this Coast.

Messrs. Palmer, Hanscom & Co., have removed their Foundry to 19 and 21 First street, of which an illustration appeared in our last issue.

Messrs. Torquet & Co., of the Vnleau Foundry, are actively employed in the construction of new steam engines and locomotives for the Oregon Steam Ship Companies.

In passing through Market street, the busy hum of the Boiler works of Caffey & Risdon greets one's ear, Devoe & Co. are also well employed in finishing fine machine work.

Senator Morrill, of Mariposa, etc.

We owe this gentleman our unbounded thanks for introducing a concurrent Resolution in the Senate, asking our Representatives to cause to be published in this State, and through the Press all the facts data and particulars of the patents as issued by the United States. As a Legislator, this gentleman probably has not his equal in the United States; having been returned from year to year from a number of Counties, by his discriminating and staunch constituents. His versatility as a speaker pleases us particularly; and for expediting business his services are important to his compeers. We hope to see him next representing us in Congress. So mote it be.

HIGHLY GRATIFYING!

The Manufacturers Encouraged—Prices to be Awarded.

Our humble efforts to promote the interests of our manufacturers and producers have at last gained a point with our law makers. Political economy prompts these to encourage our domestic enterprizes; and not until we shall have had a complete trial of all the industrial pursuits can we count the State of California a truly prosperous State! No State or county can attain pre-eminence unless it produces and exports. We have since we published the Press, advocated these principles, and have pointed to proposed investments and paying operations, to counteract it possible against the shipment of millions of dollars annually to foreign shores. There is any amount of capital lying dormant in the Pacific States, which might be obtained at a reasonable percentage, to be applied for developing our industrial resources, and where is there a country that has a greater field, capacity, soil, natural products or climate, than California? The spheres for a market for any and all productions, are becoming daily greater, the whole Pacific Coast is fast becoming populated and hence their necessity for all commodities is apparent. The days therefore for importing heavily from foreign and American ports will be lessened and we the Pacific States, will be able to furnish our *quantum* of articles for export as well as our Sister States. The present Legislature in offering these prizes have thus made a beginning in the advancement of our domestic interest that will bring gladness unto its people; and these will cherish that act above everything dear to them. The following report was read from the Assembly Committee to whom this bill was referred:

Your Committee beg leave to state that they consider the measure presented in the bill of vital importance to the agricultural and other business interests of the State. That, in their opinion, its effect will be to secure to our farmers a greater diversity of crop, to our business men more extent and variety of trade, and will provide new avenues of employment to the industrious working men of California. That no appropriation under this bill will be called for until, in each case, a new element of taxable wealth has been introduced. That no payment will be made by the State until our own capability of production is demonstrated.

The following comprises a list of prices thus awarded:

For the first one hundred bags of Sugar, containing one hundred pounds each, produced from Sorghum, five hundred dollars; for the same quantity produced the next succeeding year, two hundred and fifty dollars; for the same quantity, produced the second succeeding year, one hundred and fifty dollars; for the same quantity, produced the third succeeding year, one hundred dollars; for the same quantity of Sugar, produced from Sugar Cane, the same premiums and upon the same conditions shall be paid; and also, for the same quantity produced from Beet Root, the same premiums, upon the same conditions.

For the first two hundred hales of Flax, of two hundred pounds each, five hundred dollars; and for the same quantity, produced in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first two hundred bales of Hemp, of two hundred pounds each, five hundred dollars; and for the same quantity, produced in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first one hundred bales of Cotton, of three hundred pounds each, one thousand dollars; and for the same quantity produced in the first, second, and third succeeding years, five hundred, two hundred and fifty, and one hundred and fifty dollars, respectively.

For the first one hundred bales of Tobacco, of one hundred pounds each, two hundred dollars; and for the same quantity, produced in the first, second, and third succeeding years, one hundred and fifty, one hundred dollars, and fifty dollars, respectively.

For the first one hundred cases, of fifty pounds each, of Manufactured Tobacco, two hundred dollars; and for the same quantity, produced in the first, second, and third succeeding years, one hundred and fifty, one hundred dollars, and fifty dollars, respectively.

For the first ten bales of Raw Silk, of one hundred pounds each, five hundred dollars; and for the same quantity, produced in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first one thousand pieces Cotton Drilling, of fifty yards each, one thousand dollars; and for the same quantity, produced and manufactured in the first, second, and third succeeding years, five hundred, two hundred and fifty, and one hundred dollars, respectively.

For the first one thousand pieces of Burlaps, of forty yards each, suitable for wool sacks, one thousand dollars; and for the same quantity, produced and manufactured in the first, second, and third succeeding years, five hundred, two hundred

and fifty, and one hundred dollars, respectively. And for the same quantity of the same article, suitable for grain sacks, the same premiums.

For the first twenty-five bales of Cottonized Flax, of one hundred pounds each, five hundred dollars; and for the same quantity of the same article, manufactured in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first one hundred pieces of Linen, of forty yards each, suitable for shirts or miner's frocks, five hundred dollars; and for the same quantity of the same article, manufactured in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first one hundred pieces of Calico, of thirty yards each, five hundred dollars; and for the same quantity of the same article, manufactured in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first one hundred pieces of Cotton Shirts and Sheetings, each five hundred dollars; and for the same quantities of the same articles, manufactured in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first one hundred pieces of Broad Cloth, Pilot Cloth, and Tweeds, of forty yards each, five hundred dollars; and for the same articles, manufactured in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first five hundred cases of Boots or Shoes, of 24 pairs to the case, five hundred dollars; and for the same quantities of the same articles, manufactured in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first ten chests of Tea, of twenty-five pounds each, five hundred dollars; and for the same quantity of the same article, produced in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first ten bags of Coffee, of fifty pounds each, five hundred dollars; and for the same article, produced in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first one thousand cases, of clear Beer, for export, proved to withstand sea voyages and changes of climate, five hundred dollars; and for the same quantity of the same article, produced in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first plantation of Cotton, of ten acres or more, in bearing of good staple, two thousand dollars.

For the first ten cases of Indigo, of one hundred pounds each, five hundred dollars; and for the same quantity of the same article, produced in the first, second, and third succeeding years, two hundred and fifty, one hundred and fifty, and one hundred dollars, respectively.

For the first five thousand pounds of Rice, two hundred dollars; and for the same quantity produced in the first, second, third succeeding years' one hundred and fifty, one hundred dollars, and fifty dollars.

Newly Invented Amalgamators.

Messrs. Goddard & Co., on First have under way twenty-five new styled and highly improved Amalgamators. This firm has ever been on the alert in bringing mining machinery to perfection. Their quarts mill has become renowned throughout the Pacific States. The new Amalgamators are of simple construction, extremely novel and practical, and we doubt not their use will become universal. In our next issue we shall give a full illustration of these Pans.

Chas. R. Bond, Esq.

We announce with pleasure that our friend whose name appears above, has become one of the firm Messrs. Cobb & Sinton. *Apropos* this is probably the strongest "team" in this line of business in this City. Mr. Bond has been our Assessor, and is therefore well posted as to titles, value, and other particulars pertaining to real Estate. The General has not his equal as an auctioneer.

An Inventive and Scientific Lady.

Our attention was attracted to two beautifully finished picture frames, now in Mr. Duncan's Sales Rooms. The entire frames $3\frac{1}{2} \times 2\frac{1}{2}$ ft., of modern style ornamental shape, and are covered with an apparently coat-of-mail, of acorns, with such exactitude and nicety as to call forth amazement. The amount of labor expended must have been great. The ornaments represent some of the quaintest and most beautiful designs we have ever seen. Mrs. Mary Taylor, of Stevens Bar, Tuolumne county, is the exquisite artist.

WANTED.—A copy of the Patent Office Reports (Mechanical) for 1857.

Correspondence of the Press.

VIRGINIA CITY, N. T., March 31st, 1862.

Editor Press—Sir: your issue of the 25 ult., contains a letter and diagram relating to the Pioneer Coal Company, in this Territory, of which I am a Director and Secretary, and forwarded by me as a "private communication" to a friend of mine in your City, who had visited the mine, and wished me to write him in regard thereto. It was not intended by me to be published and I was very much surprised to see it in the columns of your journal. I will know that the information contained therein would have been considered interested to your readers I would have entered more fully into details and endeavored to make my communication worthy of the notice given to it.

As you appear to be interested in the progress and developments of the coal fields of this Territory, I will with your permission, from time to time keep you informed of any matters of interest which may arise in the future working of the Pioneer Coal Company's Mine.

Trusting you will notice this in your next issue, I remain, sir, your obedient servant,

WM. ANKLINS.

(We are not only deeply interested in the progress of this new coal, but shall only be too glad to publish any information respecting these mines and hence accept your kind offer. Your speedy answer with a detailed account of your operations thus far will greatly oblige the

EL. of the Press.)

DOWNSVILLE, March 21, 1862.

El. Mining and Scientific Press—Sir: I arrived home last Wednesday and found things about as usual. I had a terrible trip from Mayville, we got along very well for the first ten miles, having 14 passengers in one of Green & Co.'s passenger wagons. It rained in torrents, all at once down we went and the first thing I heard was "out gentlemen!" and from that to Dubuque, we had to get out many times, and to help pry the stage out.

A man named Phillips was killed at the Primrose Quartz Co., at Hay Canon he had been put in a blast; a blast went off in the drift overhead and he thought it was extinguished. He was warned not to go to it, as he came to it, it went off and he was killed. He lived but a short time.

The weather is fine; all the quarries are running, and I think we will have some large runs to account to you. Chinenmen are making good wages right in the sand on the old Jersey Company. Right in town there is as high as five dollars a day made by white men with rockers. Hill & Mealy, of Hay Canon, about a half mile from here have not crushed much rock lately, they with assistants have struck another ledge and are taking out rock now richer than ever and promises to be extensive. The bounty of this ledge is that only two men own it. At Rock Creek two miles from here I understand the boys are taking out good pay, and in fact I think if this weather continues we will have good times.

Some claims I find by enquiry at Forest City and Wet Ravine are paying well. The roads are now drying up and we will soon have the roads fixed and stages running in here which will seem more like living. I will advise you soon again if I can do so to your satisfaction. Respectfully yours,

C. W. GILBERT.

An Extraordinary Salt Well.

One of the most extraordinary salt wells on record, perhaps, is that now being operated at Wellsville, Columbiana county, Ohio. The well was sunk in anticipation of finding oil, but when at a depth of four hundred and eighty feet, the borers struck a vein of gas, which burst forth with such violence as to eject all the tools used in boring, together with two hundred feet of pipe which had been previously introduced.

The boring had developed a very strong vein of salt water, and the gas continued to spout the whole column of salt and fresh water furnished by the well, to the height of one hundred and fifty feet for six months. The idea of manufacturing salt was then conceived, and after the necessary pans, tanks, etc., were put up, the work was commenced. The gas, brought in pipes from the gasometer and introduced into the furnace in various jets, which, being ignited, perform the whole office of evaporation without any other fuel. The furnace glows with an intense heat, and the flame issues from the top of the chimney. The salt flows at the rate of about six gallons per minute, and there is more than sufficient gas to evaporate the whole. It yields about a barrel of salt per hour. The gas furnishes a pressure of one hundred and eighty-six pounds to the square inch, which is eighty or ninety pounds per inch more than is usually allowed in running a locomotive engine. The well is a most extraordinary one, and the owners, though they failed to find oil, will, it is believed, make a handsome thing out of it.—*Sac. Bee.*

STEEL MANUFACTURE.—At the Manchester Literary and Philosophical Society, Mr. Brockbank exhibited some samples of steel manufactured by Mr. Bessemer's process. These specimens had been bent and twisted cold, and showed a remarkable degree of difficulty. He stated that the Bessemer steel was one of the most plastic and manageable of metals—more so even than copper. It could be bent, flanged, or twisted, either hot or cold, without annealing, and over a considerable range of temperature, which is not the case with ordinary steel or copper. A plate of 18 inches diameter had been forced through a series of dies until it formed a tube 13 ft. long and 1½ in. diameter, without any crack or flaw. A ring of metal could at once heat be hammered into a die to form a locomotive engine chimney top. In drilling a circular hole into a plate, continuous shavings are formed—whereas, in copper, or low Moor plates, or any other metal the shaving break into pieces 1-16th in. long. Thin sheets of the Bessemer soft steel can be bent backwards and forward hundreds of times without fracture, and are almost as flexible as paper.

MOUNT BAKER A VOLCANO.—It appears that Mount Baker is an active volcano, and has been in a state of eruption. The following extract from the "Columbian" gives the particulars: Yesterday morning a large volume of smoke was seen rising in the direction of Mount Baker, and upon going up to the Royal Avenue, whence the top of the Mountain can easily be seen, it appeared evident that the smoke issued out of the mountain a little below the peak. A little over two years ago smoke was observed issuing out of the same place. Mount Baker is about 50 miles in a southeasterly direction from this place, and when the forest is cut down on the ridge on the south side of the river, will be seen from any part of this city.—*Victoria Press.*

THE PRIZE ESSAYS.

TO THE EDITOR OF THE PRESS.

Sir,—Will you please inform us who those learned judges are that have decided "The Essays on British Columbia do not come up to the standard." I should like also very much to know what standard is meant: Is it certain length like that of a soldier who must be 5 feet 7 inches or be cannot be favorably received into the Government ranks, or is it the weight (to be ascertained by the apothecary's scales), of the analyses therein contained, being found below the "standard" of the quantity required to put to sleep all further enquiry into the condition of the colony? As my friend Stick and Stovepipe always has it, "I take it to be that the simple sun and substances (blow with the point of the stick stovepipe on one side) of the matter is this?" A certain high official has not been sufficiently lubricated to enable him, his land speculations, and contract jobs to be swallowed with the facility required; or it may be that sufficient subsidence is not manifested to the iron rod of despotism of another high functionary to which the neck of the aspirant for colonial honors (?) must invariably yield.

THE STEAM AIR CANNON.—This invention consists of a locomotive capable of running on common roads, which supercedes horse-power in all draft operations, and is adapted to either land or water. To this is attached one or more air cannons, which, in view of the present scarcity of powder, is a great desideratum, as air can be made more effective than powder, being liable to compression to many thousand times less than its bulks. These cannon will also have the following qualities to recommend them, viz: no report, little if any concussion, no heating, and no smoke, which proves their great availability whether placed on board of gun-boats or war ships, or used on land for river protection, where it would be most serviceable. Along the banks of the Mississippi the levees would protect the lower part of the machine, while the upper is secured by its own inclined planes. The cannon, being breech-loading, is loaded with great ease and speed; and by being removed from the machine, the latter can be applied to making ditches, throwing up the embankments, and can also be used as a fire-engine. In the open field it may be called a flying artillery, as it could run through any ranks, either of infantry or cavalry, and open a lane fourteen feet wide. This is a Louisiana invention, and we understand that the inventor, Mr. Henry Cowing, is about to submit it to the Legislature, when we hope to see it receive that attention which all such contrivances, calculated to strengthen our defences, deserve.—*Baton Rouge Advocate.*

STOCK QUOTATIONS.—The following is a list of the prices per foot of some of the principal mining stocks in Nevada Territory:

Ophir.....	\$1225@	\$1250
Mexican.....	\$4500	refused
Central.....	\$600@	\$625
California.....	\$275@	\$300
Gould & Curry.....	\$500@	\$550
Eaney.....	\$275@	\$300
Chollar.....	\$300@	\$40
Lucerne.....	\$25@	\$30
St. Louis.....	\$10	

During the first week in March some three hundred shares of the Ophir changed hands at the above figures. This company is out of debt, and has a surplus of eleven thousand dollars.—*Daily Cal. Express.*

WHILE YOU HAVE THE MONEY,

MAKE SURE OF A HOME!

NEVER HAZARD THE LAST DOLLAR!

To Cariboo and Salmon River Miners, and all others who wish to purchase LOTS in San Francisco with a PERFECT TITLE:

33. The undersigned will sell Building Lots for from \$10 to \$200. Also, 50 vara Lots and entire Blocks of the most beautiful gardening lands in the city and county of San Francisco, on the line of and at the WEST-END DEPOT OF THE SAN FRANCISCO AND SAN JOSE RAILROAD. Persons desiring to invest a few dollars, or hundreds, or thousands of dollars, would do well to call on the undersigned, as he deals only in LANDS with a PERFECT TITLE, to wit: those held under

A PATENT OF THE UNITED STATES!

Persons residing in the interior, or who are about to go to the Cariboo or Salmon River Mines, can purchase this property and leave it without any fear of adverse claims or titles springing up in their absence.

The undersigned will, if desired, give his personal attention to the assessing, paying of taxes, etc., on all lots purchased from him, and will forward to each non-resident purchaser his tax receipts, free of all cost save the actual amount of the taxes.

Removal!

A. HASSEY, Notary Public, and REAL ESTATE AND HOUSE AGENT, has removed from No. 406 to No. 428 Montgomery street, adjoining H. Heintzsch's Bank, near Sacramento street.

TO EMIGRANTS TO MEXICO.

THE UNDERSIGNED BEGS LEAVE TO INFORM THE RESIDENTS OF California that he has been appointed Commissioner of Emigration, to act in California, for the State of Sinaloa, Mexico.

The immigrants held out to emigrants intending to become permanent residents in the State of Sinaloa, are of the most liberal character; the fertility of the soil, the well known richness and extent of the mineral resources, and the salubrity of the climate, render this beautiful country a very desirable region for immigration.

Referring to the laws of the Supreme Government of Mexico, and those of the State of Sinaloa, published herewith, by these laws, he has instructions from the Government to insure to the persons first arriving in Sinaloa tracts of beautiful land in the immediate vicinity of the city of Mazatlan.

Full powers and instructions, under the seal of the Government, can be seen at the office of the undersigned, where he will be ready to impart to persons wishing general full information as to the mineral and agricultural resources of the country, and the great advantages which will accrue from the cultivation of sugar, cotton and tobacco.

ALFRED A. GREEB, Emigrant Commissioner.
Office Union Hotel Building, corner of McComb and Kearny streets.

[TRANSLATION]

DEPARTMENT OF STATE.
Office of Encouragement of Industry, Commerce and Colonization.

The citizen Benito Juarez, Constitutional President of the United States of Mexico, to all the inhabitants thereof:

Know, That by virtue of the ample powers with which I am invested, I have thought proper to decree the following:

Every foreigner who alone, or in company with other foreigners, buys a tract of land for agricultural purposes, or to establish a farm, (finca rustica,) shall be exempt for five years—counting from the day on which the papers of purchase were signed—from all taxes or contributions of any kind; being required, however, to present a plan of his possession to the Minister of Colonization, (Fomento,) without which he cannot enjoy the aforesaid privilege.

Article 2. Every foreigner, or company of foreigners, who shall buy a tract of land to found a colony, shall, with their colonists, be exempt for ten years, counting from the day on which the papers of purchase are signed, which they themselves may impose; but they must present, within a year, the plan and survey of their possessions to the Minister of Encouragement of Colonization (Fomento) under the penalty of losing the privileges granted in this article.

Article 3. The foreigners comprised in the preceding articles shall enjoy, for a further period of five years, all the privileges therein granted to them, if, at the expiration of that time, they show that the number of Mexicans employed in their colonies or lands, is not less than one-third part of the entire number of laborers or colonists therein.

Article 4. They shall not pay, for two years, any duty on imported goods, nor internal duties of any description on articles that come consigned for the use of the colonists, or for the working of their lands. Should any merchandise coming from Europe, thus introduced for the use of the colonists, be circulated in commerce, it shall be subject to confiscation.

Article 5. All colonies founded in accordance with the preceding articles—the object being to encourage foreign immigration—shall be exempt from the payment of the municipal funds which they may produce, and the authorities shall not interfere with the administration of the same.

Article 6. The inhabitants of the colony thus formed—in which belongs to the fulfillment of the privileges conceded by this law, and the privileges mentioned in the Constitution of the Republic—shall, for a period of two years, enjoy the same rights which they would enjoy in their respective nations, or the use of the owner of the property to which the great number of the colonists belong.

Article 7. All owners of farms (finca rustica) and colonists remain entirely subject to the laws of the country in all the points not explicitly determined in this law, with the reservation of the terms specified in the preceding articles.

Palace of the Federal Government, in Mexico,
March 31, 1861.

To the citizen Ignacio Ramirez, Minister of Colonization, Industry and Commerce.

God and Liberty!
Mexico, March 13th, 1861.

RAMIREZ.

[TRANSLATION.]

Placido Vega, Constitutional Governor of the State of Sinaloa, to the inhabitants thereof:

Know: That the State Congress thereof has directed to me the following decree:

No. 30. The people of the State of Sinaloa, represented by its Congress, decree the following:

Article 1. All public or vacant lands (Los terrenos y aguas validas) and water in Sinaloa are the property of the State. One half of them are dedicated to protect national and foreign immigration, and to constitute a branch of the public revenue (erario publico).

Article 2. Every immigrant or company of immigrants coming with capital to settle in Sinaloa will receive, free of charge, the quantity of land necessary for the colony he or they may establish, with no other expense than that of the survey.

Article 3. All foreign immigration will be exempt from duties and taxes of any kind, and from military service, for five years. Foreign immigrants will, moreover, enjoy the privilege of establishing their own government and municipal legislation, provided they do not oppose the general laws of the State.

Article 4. The Government will issue the most proper and positive orders, so that immigrants will not be molested, or embarrassed by the anticipation of the fiscal laws; and from the time that they enter the State until they arrive at the place where they may establish their residence, and during the term of their residence, they shall be protected and favored by the local authorities, when such favor and protection may be required.

Article 5. The inhabitant of the State who thus cultivates and gathers within his property an hundred bales of cotton, or twelve arrobas (300 lbs.) each; one hundred arrobas, (25 lbs. each) of coffee or of sugar, shall receive a quantity of three thousand dollars, to be drawn from the State Treasury, in preference to other demands.

The Government will provide for the most complete execution of this law, and direct that the unoccupied lands (terrenos validas) within the district of Mazatlan be first surveyed.

Communicate this to the Executive for publication and fulfillment, Hall of Sessions of the Congress of the State, Mazatlan, 15th January, 1862.

FRANCISCO CORTES, Diputado Presidente.

FRANCISCO J. ARAGAN, Diputado pro Secretario.

JOSE VALADES, Diputado pro Secretario.

Wherefore, I order this to be printed, published and circulated for exact observation.

Port of Mazatlan, Jan. 16th; 1862.

PLACIDO VEGA.

FRANCISCO FERREL.

[Seal.]

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving us it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miners Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3d. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer: together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 39 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in a comprehensive and accessible form, and is of great value to the miner and metallurgist. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

A BOOK FOR THE MINES.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work the Miner's Companion and Guide, and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found necessary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINERS.—Our thanks are due to Mr. Silversmith of the "Mining and Scientific Press" for a copy of the "The Miner's Companion and Guide," being a compilation of most useful information, together with a

lossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's hidden treasures.—[Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,812 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths fine......3cts per oz.
 " from 300-1000ths. to 750-1000ths fine. 7cts " "
 " " 750-1000ths to 950-1000ths " 14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce 1/2 per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
 301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, 1/2 per ct. gross value of silver for making bars; also when gold is contained 1/2 per ct. on gross value of gold for coining. Refining charges as in purchases.

BAR SOLD FROM REFINERY.

\$1 21cts. per standard oz. 1/2 per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. 1/2 per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. 1/2 per ct. gross value of deposit for making bars.

In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of 1/2 per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and he imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

REAL ESTATE for sale in all portions of the city. Loans negotiated on Real Estate and other securities. Deeds, mortgages and liens, accurately drawn up. Soldiers' Pay Claims made out and purchased on liberal terms; and claims against the United States and State Governments collected. Fbl.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Shoes and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flaming Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tuh, lately improved, in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Cur Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GO DDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour ter arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and ye simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

SPECIAL NOTICE.

HIGHLY IMPORTANT INVENTION IN DENTISTRY.—Dr. D. STEINBERG begs leave to announce to the citizens of this city, that letters patent for his valuable improvements in mechanical Dentistry were granted him on the 12th of November last.

This invention consists in the application of GUM ENAMEL to gold plates for artificial teeth, and are acknowledged to surpass all others in use, for their beauty, style and exactitude of fit; their weight compared with others is less but are far more durable by the addition of the gum enamel. Specimens of this valuable invention may be seen and examined at the dental office of the undersigned, No. 648 Washington street, near Kearny. Great care and attention is devoted to the perfect filling of teeth. Teeth extracted by the new process.

STEINBERG & SIEHEL,

DEVOE & CO.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefitted by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Lock Box 537, P. O.

Room 24, (formerly) U. S. Court Building, Corner of Washington streets, San Francisco.

Caveats and Patent Applications.

We are enabled through our legal connection at Washington and European Patent Bureaus to obtain Letters Patent for inventors and discoverers on this Coast, WITH LESS EXPENSE, and GREAT ECONOMY of TIME, than any other firm in the United States. Those requiring our services will please address us by stating the nature of their invention with a sketch, or drawing, thereof, also a model if possible. The Government fees are as follows:

On every application for a design, for three years and six months, \$10; on every application for a design, for seven years, \$15; on application for a design, for fourteen years, \$30; on every caveat, \$10; on every application for a patent, \$15; on issuing each original patent, \$20; on filing a disclaimer, \$10; on every application for a reissue, \$30; on every additional patent granted on a reissue, \$30; on every application for an extension, \$50; on the grant of every extension, \$50; on appeal to the commissioner from examiners in chief, \$20; on every appeal to the judges of circuit court, D. C., \$25.

WOOD ENGRAVING.—This office undertakes the preparation of Illustrated Catalogues and Circulars for Engineers, Agricultural Implement Makers, Hardware Dealers, Jewellers, Printers, Patentees, and other kinds of Wood Engraving; and, from considerable experience in Illustrating Mechanical Journals, can insure accuracy of detail both in the Drawing and Engraving. This is secured by employing professed Mechanical Draughtsmen in the preparation of the Wood Blocks.—Drawings taken from Photographs.—Estimates furnished.

Address
JULIUS SILVERSMITH,
Solicitor, State Capitol Building, cor. Wash. and Battery, San Francisco, Cal.

Pyrites or Sulphurets.

Heretofore we have made it our task to ferret out some practical process by which the metal from Sulphurets may be successfully extracted. We went even so far as to offer a handsome bonus for the best assay or treatment. We are yet without *modus operandi*. We have said a great deal respecting this but cannot fail to revert to this subject sometimes. Among recent inventions and discoveries we have noticed some very excellent machines such as Banham's hydro-electro A amalgamator, Deetken's Hydro-chloric process (German) and others, we should be pleased to hear something from metallurgists upon the subject.

CALIFORNIA AND OREGON S. S. LINE.

—FOR—

Eureka, Trinidad and Crescent City, Touching at Mendocino

The Steamship

SIERRA NEVADA,

THOMAS HUNTINGTON—Commander,

Will leave Folsom st. Wharf for the above Ports,
TUESDAY.....APRIL 8, 1862,

At 4 o'clock, P. M.

For freight or passage apply on board, or to

HOLLADAY & FLINT, Proprietors.

Office 407 Washington street, opposite the Postoffice.

Bills of Lading will be furnished to shippers of cargo. No others will be signed.

State of California, City and County of San Francisco. Chas. C. Bemis, U. S. Inspector of Boilers for this district, being duly sworn, says that on the 21st day of February, 1862, at the request of Messrs. Holladay & Flint, he tested the boilers of the steamship "Sierra Nevada," and applied a hydrostatic pressure of 24 pounds to said boilers per inch, and that they withstood the pressure without any trouble, difficulty or evidence of weakness; that being the usual pressure to boilers of that description, no severer test was applied or deemed necessary. From my inspection of her machinery and boilers, I pronounce her entirely safe and seaworthy so far as that department is concerned.

U. S. Inspector of Boilers.

Sworn and subscribed before me this 31st day of March, 1862.

CIRCULAR.

SAN FRANCISCO, April 8th, 1862.

SIR: The undersigned having associated with themselves CHARLES R. BONI, (late Assessor of the City and County of San Francisco) will continue the REAL ESTATE AUCTION AND AGENCY BUSINESS under the firm of COBB, SINTON & BOND.

We hope that our well known experience, added to that gained by our now associate as Assessor during a term of five years, will assure a continuance of liberal patronage from parties desirous of purchasing and selling Real Estate and Stocks; and with that view offer our services to our friends and the public.

All matters pertaining to Real Estate will be promptly attended to, and strict attention given to all Legal requirements in Sales of Administrators, Receivers, &c. &c. Out-door and other Auction Lots promptly attended to.

Respectfully,

H. A. COBB,
R. H. SINTON.

ap9ltf

Kesmodel's Apparatus of Making Pads for Hernia.

In a number of this journal a few months since we gave the above illustration but failed to give more minute details of its principles or objects. We copy from the patent granted the following which sufficiently explains the mechanical operation of the apparatus:

I propose to form pads for supporters by taking a cast of the injured part of the body and the parts adjacent thereto, said cast to be used for the formation of the pad. For this purpose I prepare a frame of any desired size and shape; see figure 6, letter A. The lower opening of this frame is to be covered with a thin piece of rubber or other elastic material, and secured thereto as described above. A mould box thus formed is to be filled with a paste of plaster of Paris; the plunger is then pressed upon the plaster, and the apparatus applied to the injured part and pressed thereupon; the elastic covering of the mould box yielding to the pressure, will form an exact cast of the injured part, and of the parts of the body adjacent thereto. The pressure of the apparatus may be regulated by the hand of the operator, or by attaching the same to the truss or other supporter, in place of the usual pad; the same pressure will be obtained as that of the pad to be used. The cast thus obtained is now to be used as a model for making a pad of metal, horn ivory, gutta percha or other suitable material.

It is obvious that pads made in this way must (even when made of hard material) be much more comfortable to the patient than those made in the manner heretofore in vogue.

But the principles and application of this highly valuable invention present other and more scientific advantages, which must hereafter prove of material benefit, and the alleviation of those suffering from Hernia and similar ruptures, in the surgical profession. The parts ruptured have heretofore been made to conform to the artificial pad, but now this order is reversed; the apparatus is provided to take an exact impression of such rupture, hence if ligaments, bones, muscles or cords should occupy any of the afflicted parts, their impression will make themselves apparent and the pad when applied will not create an unnecessary pressure upon such, and cause them to be painful or injurious to the patient. We refer the reader more particularly to the advertisement elsewhere.

FREDERICK KESMODEL,
Cutler and Surgical Instrument Maker

817 KEARNY STREET,

Between Jackson and Washington streets,
SAN FRANCISCO,

RECEIVED a diploma at the Fair of the Mechanics' Institute, September, 1858, also in Sacramento in 1861 for California made Cutlery.

The attention of those afflicted with HERNIA, or Rupture, or any one interested, is called to his new method of fitting and adapting Trusses to the different cases. It is a well known fact that there has as yet been no system of fitting Trusses. There are many different styles which have proved good in many cases, but they are all uncertain and cannot be relied on, and in severe cases are altogether useless. The following are some of the advantages I claim for these Trusses above any and all others: First—The Pad is formed on the parts to be compressed by taking a plaster cast. Second—Having a correct model, it enables me to make the Pad of any desirable material, such as horn, ivory, etc. Third—The Pad is so adjusted to the spring that no movement of the body will move or displace it. There are many other advantages. Examine and judge for yourselves.

FREDERICK KESMODEL,
Inventor and Patentee.

ap3ltf

STOCKTON MALE AND FEMALE
SEMINARY.

THE first aim of this Institution is thoroughness; and although any plan proposed can only be disciplinary, yet we have chosen that course which will be the most practical, involving those sciences most available in common life. Beginning with fundamental principles, the student is carried by natural and easy gradations, through a course of study calculated to strengthen and invigorate the mind, and prepare it for healthful action.

Our Course of study comprises two Departments—A Preparatory of two, and an Academic of three years. The studies of the preparatory course, the first year, comprise reading, writing, orthography, Arithmetic (Thompson's Rudiments), primary geography, grammar and composition. The studies for the second year are rhetorical reading, arithmetic, book-keeping, geography, history, grammar, penmanship and composition. The studies of the Academic course—first year—algebra, geometry, natural philosophy, physiology, rhetoric, physical geography and composition. Second year—trigonometry, astronomy, natural history, botany, logic, intellectual philosophy and composition. Third year—political economy, moral philosophy, evidences of christianity, belles lettres and composition.

The ancient and modern languages, music (instrumental and vocal), drawing, painting and ornamental needlework, optional through the whole course. Pupils can omit, with the consent of parents or guardians, any of the above studies, but none will be entitled to the Diploma of Graduation who have not completed the whole course. It appears that the terms are convenient, as will be seen by the annexed schedule of prices in each branch or department.

For board and tuition, in common English branches, per session, \$150 00; music, per session, \$50 00; painting or drawing, \$25 00; ancient or modern languages, each \$25 00; washing, per dozen \$1 50; for tuition and board, per annum, \$250 00.

GET THE BEST

WHICH IS ALWAYS THE CHEAPEST IN THE END.

J. S. SMITH'S PATENT ELLIPTIC SPRING BED BOTTOM,

Manufactured by

J. DALE BURTON & CO.,

Manufacturers of and Dealers in all kinds of

BED ROOM FURNITURE.

Also constantly on hand or made to order, Bedsteads of every description, Bureaus, Tables, Cane and Wood Seat Chairs, Stools and Office Chairs and Desks. Teachers' Desks and School Furniture manufactured or imported to order; Hall Furniture, Settees, &c., at

THE LOWEST RATES FOR CASH.

Don't fail to call and see the BED BOTTOM that will last longer, that is easier to rest upon, that makes the least dust in the rooms, that has no place for vermin to live, that is the most convenient to move, that is always in good order, that is warm in cold weather and cool in warm weather, and above all other considerations,

THE CHEAPEST BED BOTTOM EVER OFFERED IN THIS MARKET!

Homesteads Cheaper than Proposed under the Shafter Bill.

UNDER THE PROVISIONS of what is known as the Shafter Bill, it is proposed to sell the city title to homestead lots for twenty-five to two hundred dollars each.

The undersigned will sell homestead lots within the limits of the city, and miles nearer to the business centre than many of the lands covered by the Shafter Bill, and place the party in immediate possession of the same, without present trouble or prospective lawsuits, for from \$10 to \$20 each. THE TITLE is absolutely PERFECT, being a Spanish Grant, finally confirmed and patented by the United States. The Shafter Bill respects this title: the city authorities respect it; the District Court and the Supreme Court of the State, as well as the District Court and Supreme Court of the United States respect it; besides the TITLE HAS BEEN FOREVER QUOTED BY A FINAL DECREE AND JUDGEMENT AGAINST THE CITY so that there is not even a cloud or shadow upon it. Whoever purchases one of these lots will buy a lot, not a lawsuit.

STANFORD BROTHERS—OIL AND SPIRIT WORKS.

Among home manufacturers on this coast few compare with Messrs. Stanford Bros., who, for several years past were among the first to enter upon an enterprise that would defy competition and what is more than all avoid a fluctuating market in oils and spirits. The above illustration represents an excellent view of their extensive factory and distillery at North Beach. This firm have an enviable reputation in the Pacific States, Mexico, Sandwich Islands, for their genuine products, of which a detailed list appears elsewhere in this issue, also for their ubiquity and reliable fulfilment of every commission entrusted to them. They are extensively engaged in the importation of many new and improved household utensils. Such as Lamps of every size, shape and style, etc., their warehouse is situated S. E. corner of California and

Front street, of which their House in Sacramento is a branch. In the manufacture of oils, turpentine, alcohol, Kerosene, and other spirits these gentlemen are probably better posted any than similar House in this State, and as manufacturers of the same, they have gained a preeminence over every other competitor.

We are informed that more than two-thirds of the articles above mentioned, and consumed in this State are manufactured by this firm; they have in their employ a number of experienced chemists and workmen with all the latest and most improved utensils at their command. Messrs. Stanford Bros. are entitled to considerable credit for their enterprise and the success they have thus far met with justly entitles them thereto. We have in course of preparation some in-

teresting facts pertaining to "Kerosene" which will soon appear.

AGE OF THE WORLD—WHAT SAYS GUANO?—The deepest deposits of guano known is 70 feet. According to Humboldt, a deposit of three centuries would not exceed more than one third of an inch in thickness. By an easy mathematical calculation, it will be seen at this rate it would take almost countless centuries to form the deepest guano bed.

Such a calculation carries us back towards a former geological period, and proves that in the past ages a greater number of birds existed.

The tin, copper, and coal mines in England produce some \$280,000,000 each year, at a regular cost of 3000 lives. It is estimated that the coal mines will last 700 years yet.

The Application of Science to the Useful Arts.

As Science becomes freed from the fetters of foundationless logic and speculative philosophy, it was prepared for rapid advancement under the principles of Bacon's system, and as the consequence we have the progress which the Arts have made during the last two centuries. The general character of the natural forces with which we have to deal have become known and their practical appliance is but the state of the Arts which we witness to-day.

A knowledge of the principles involved in the existence, —solid, liquid and gaseous,—is in the first place necessary to a just apprehension of the materials with which in the Practical Arts we have to deal. A solid may be supposed to be made up of particles capable of compression and extension, and possessing elasticity. When a force is applied to a solid at one point, its tendency is to move the whole body, in the direction of the impeding force; as in the figure,

a force in the direction *ab* would move the solid *cd* in the direction of *abc* continued. But a balance of forces may be effected, and if a second force operating upon the body exactly opposite *b*, and just equal to the force at *b*, and in the direction *d c*, it would be a counterbalancing force; and however great these forces were, the solid would remain a rest. The law of the force is, that when the body moves it will move only in the direction of the force applied.

But with liquids this is not so, for if a piston be forced into a vessel of water in the direction *ab*, the pressure will be felt not only at *c*, but upon the upper and lower sides, and in every part of the vessel to an equal degree; and if the piston be an inch square, pressing with the weight of one pound, every square inch of surface throughout the vessel will receive one pound of pressure. Thus it will be seen that a different law prevails here, and through the discovery of the principle by which a great amount of pressure upon a given surface may be obtained by the exertion of a small force, was made by Pascal, this was not practically applied until within the last sixty years!—and now it is employed in the hydrostatic press.

In the gaseous form of matter still different principles are exemplified; for while both solid and liquid bodies resist compression, except in a small degree, the compressibility of aeriform bodies is their most noticeable characteristic; and instead of their particles being held together by a strong cohesive force, as in the two former cases, they are mutually repellant, and were it not for their weight, the particles of our atmosphere would diffuse themselves through infinite space. Consequently elasticity remarkably distinguishes matter in the gaseous form; and it is susceptible of extraordinary condensation or compression. These attributes of the three forms of matter are fundamental in the Arts.

But there are certain principles underlying all matter, which connect them in one class. In general: the component parts of materials are always at a certain distance apart, and possess in their solid, liquid or aeriform state both the powers of mutual attraction and repulsion. The simplest mechanical idea we may have of matter, is, that it is made up of infinitely small particles, between each of which and its neighbors is interposed a minute spring, having the power to keep them at a certain distance. When by an external force the particles are driven into closer proximity, the energy of the springs throughout the mass is brought into action and resistance; and as soon as the compressing force is removed they recoil again to restore the particles to their natural places. In gases these springs have no known limitation in action, and in solids and liquids, they cease to act at considerable distances; though until they are broken by disruption of the particles, they act with greater efficiency.

The mutual action of forces and particles in a solid, are well exhibited in the case of a wooden rod. Striking upon the end of the rod, it is natural that the part struck should move by the force of the blow; but it is observed that the particles at the *opposite* end of the rod, which are not struck, also move, which is impossible unless by some connection of the particles throughout the rod. As the rod is not shortened by the blow, the particles must maintain their original distances, and there is no conceivable way of this transference of motion from the particles at one end to those at the opposite, except that when the particles receiving the blow communicated their force to those adjoining, they were forced nearer to those adjoining or approximating particles than the repellant forces between them would allow to remain, and in the recoil of the spring or repellant force between these particles, the second set were urged forward in order to give the requisite space for the first set to resume their normal relations to those around them, as the original force applied would not admit of the instantaneous retreat of those impinged upon. The second set of particles communicated their motion to those next beyond, and they to the next, and so on, until every particle in the entire rod receives and conveys its motion or force, until the last is reached, where its recoiling spring forces it to the proper and natural distance from those which approached too closely, and thus the whole rod was carried forward before the force of the original blow.

So if a force be exerted upon a ball, unless other forces be allowed to operate, it will move in the direction of the applied force through the instantaneous communication of the force throughout the ball. But if an exactly equal and opposite force he used simultaneously with the first, the compression of particles at first taking place will bring the repellant forces of each particle into play, and all responding with exactly the same force with which they were compressed, will regain their original places and the ball will remain at rest. If such opposite and equal forces are applied in every conceivable direction, however great they are, they will cause no motion in the ball; but the weight of a straw will suffice to destroy the equilibrium and motion will ensue.

With this knowledge of the principles of matter we are now able to trace some of their interesting and useful appliances in the Practical Arts. And first, let us consider Mechanism and measurement of mechanical forces, the credit of the first scientific investigation of which is due to Galileo and Archimides, the latter of whom developed the beauty and power of the Circle and Lever; and the former of whom first scientifically discovered the laws of the remarkable "Triangle of Forces."

When three forces act on a point in equilibrium, a triangle whose sides are parallel to the direction of the forces will always represent, in the relative length of its sides, the due amount of each force in causing the motion, or the imposed weight or pressure which ensues. This convenient manner of learning the ratio of forces is of great importance to the carpenter, builder, architect and engineer, and is useful to all. Suppose it is desired to know the requisite strength of an iron rod, to support a swing sign,—commonly familiar as hung before old-fashioned taverns. The rod upon which the sign, or other weight is to hang, projects horizontally from the wall. Attached to its outer end and reaching to a fastening in the wall, above where the first is made fast, is the suspending rod, the strength of which is to be determined. The three forces now operating upon the point of suspension of the sign are: *a*, the weight of the sign downward; *x*, the oblique pull upward of the suspending rod; and *y*, the outward force of the horizontal rod, brought into play by its resistance to the tendency to be crushed inward by the union of the other two forces. Let lines be drawn parallel with these directions of the acting forces and the ratio of lines will be the ratio of the forces; and as the perpendicular force, or the weight of the sign, is known, the others are simply determined by working the proportions

length *a* : length *x* : weight *a* : force *x*.
length *a* : length *y* : weight *a* : force *y*.

It is evident that if the oblique suspending rod is twice as long as a line connecting its upper end with the end of the horizontal rod where it enters the wall, then the strain upon it would be twice as great as the weight of the sign, &c.

A most universal application of this law of the ratio of forces is seen in the common double-sloped roof. The weight of the roof now becomes the downward perpendicular force, and the directions of the remaining two forces are in the lines of the rafters. This weight, and the length of the rafters being known, it is easy to determine the compressing force that will be brought to bear upon these. And if it be sufficient to crowd the walls of the building outward, the strength of the tie-beam to be employed to prevent this is known. Sometimes a stud is erected perpendicularly upon the tie-beam and reaching the rafters where the ridgepole rests. This is to support the tie beam, which from its own weight will often bend downward, thus drawing it inward and forcing the summit of the roof upward. When the tie-stud is employed it is evident that the *very weight* placed upon the tie-beam tending to pull its ends inward and throw the summit of the rafters upward, also pulls the tie-stud upward, and *supports itself!* The genius who discovered this should be immortalized, but his name is unknown.

Such names should not be lost: the world has none too many of them, for they are benefactors. Like Humphrey Potter, who when left to open and shut the valves of Newcombe's steam-engine, surprised his employer, who came back to find the contrivance of the hour opening and shutting the valves by the engine's own motion, while Humphrey was standing back and coolly viewing the operation. He had made the engine an automatic machine! Such desire to escape work is desirable: it is the indolence of a Newton, a La Place, an Archimides: it is brainwork saving the drudgery and waste of the body. This indicates what a machine is: an ingenious contrivance between the force and the work.

The force of a machine may also be estimated like that in quietude. To obtain a duty, greater weight and less speed, or greater speed and less power are inevitable conditions. The speed multiplied by the force, or the force into the space, are the unchangeable estimate. If 10 pounds move through 1000 feet, 100 pounds must go but 10 feet. Under this inexorable law perpetual motion is the unnecessary dream of the ignorant. But under its provisions we may transfer speed to power and *vice versa*, according to desire, and through this facility the turbine planes the wood, grinds the corn, &c. Or, at will, motion may be converted to heat and heat reconverted to motion. In the Alps where numerous waterfalls exist, they turn machinery to give friction, and friction is used to generate heat and steam. Thus heat equals force. By its contrivertible power, one pound of coal equals a muscular day of ten hours. And we are led from mechanics, through heat and electricity to chemistry.

WANTED.

The proprietor of this journal desires one or two gentlemanly persons to act as solicitors or canvassers for this paper. Good wages allowed.

GREAT REDUCTION IN PRICES.

STANFORD BROTHERS,
121, 123 and 125 California Street,

GUSTAVE A. SCOTT

Would respectfully announce to his friends that his
FIRST GRAND CONCERT WILL TAKE PLACE

ON
THURSDAY.....April 24th, 1862.

AT
PLATT'S NEW MUSIC HALL,

When he will be assisted by all the PRINCIPAL VOCAL AND INSTRUMENTAL PERFORMERS OF SAN FRANCISCO, all of whom have kindly volunteered to assist.

The programme, which will shortly be published, has been selected with great care, and will comprise Solos, Trios, Quintettes, Orchestral and Choral selections, consisting of the finest programme, as he believes, that has ever been offered to the public of this city.

The Chorus will consist of twenty-eight of the leading singers. The Orchestra will comprise twenty of the finest instrumentalists, forming an unsurpassed combination of talent.

TICKETS.....ONE DOLLAR
To be had at any of the Music Stores.

Seats can be secured on the day of the Concert from 9 till 1 o'clock.

TO TAXPAYERS.

Delinquent Taxes of 1856-7, 1857-8, 1858-9.

THE INJUNCTION CASE IN REFERENCE TO THE DELINQUENT TAXES of the years above named, having been decided by the Supreme Court, in favor of the City, counsel employed by the City, in said case, will soon proceed to have all injunctions dissolved, when it will become necessary for the Collector to proceed at once with the sale. In the meantime suits will be commenced, under the Act of 1859, for the recovery of taxes due on personal property and on much of the real estate advertised for sale. This notice is given in order that delinquents may avail themselves of the Act of 1861, authorizing the receipt of City bonds and other evidences of indebtedness against the City in payment of these taxes, and by prompt settlement prevent the expenses and annoyance of a suit of sale of their property.

N. B.—A list of delinquent taxes can seen at the office of the Collector.
E. H. WASHBURN,
Tax Collector.

FREDERICK KESMODEL,
Cutler and Surgical Instrument Maker

Between Jackson and Washington streets,
SAN FRANCISCO.

RECEIVED a diploma at the Fair of the Mechanics' Institute, September, 1863, also in Sacramento in 1861 for California made Cutlery.

The attention of those afflicted with HERNIA, or Rupture, or any one interested, is called to his new method of fitting and adapting Trusses to the different cases. It is a well known fact that there has as yet been no system of fitting Trusses. There are many different styles which have proven good in many cases, but they are all uncertain and cannot be relied on, and in severe cases are altogether useless. The following are some of the advantages I claim for these Trusses above any and all others: First—The Pad is formed on the parts to be compressed by taking a plaster cast. Second—Having a correct model, it enables me to make the Pad of any desirable material, such as horn, ivory, etc. Third—The Pad is so adjusted to the spring that no movement of the body will move or displace it. There are many other advantages. Examine and judge for yourselves.

TO EMIGRANTS TO MEXICO.

THE UNDERSIGNED BEGS LEAVE TO INFORM THE RESIDENTS OF California that he has been appointed Commissioner of Emigration, to act in California, for the State of Sonora, Mexico.

The inducements held out to emigrants intending to become permanent residents in the State of Sonora, are of the most liberal character; the fertility of the soil, the well known richness and extent of the mineral regions, and the salubrity of the climate, render this beautiful country a very desirable region for immigration.

Referring to the laws of the Supreme Government of Mexico, and those of the State of Sonora, published herewith, the undersigned would state that, in addition to the privileges conceded by those laws, he has instructions from the Government to insure to the persons first arriving in Sonora tracts of beautiful land in the immediate vicinity of the city of Mazatlan.

Full powers and instructions, under the seal of the Government, can be seen at the office of the undersigned, where he will be ready to impart to persons wishing to emigrate, full information as to the mineral and agricultural resources of the country, and the great advantages which will accrue from the cultivation of sugar, cotton and tobacco.

ALFRED A. GREEN, Emigrant Commissioner.

Office Union Hotel Building, corner of Merchant and Kearny streets.

(TRANSLATION)

DEPARTMENT OF STATE.
Office of Encouragement of Industry, Commerce and Colonization.

The citizen Benito Juarez, Constitutional President of the United States of Mexico, to all the inhabitants thereof:

Know, that by virtue of the ample powers with which I am invested, I have thought proper to decree the following:

Article 1. Every foreigner who alone, or in company with other foreigners, buys a tract of land for agricultural purposes, or to establish a farm, (finca rustica) shall be exempt for the day on which the papers of purchase are signed, from all taxes or contributions of any kind; being required, however, to present a plan of his possession to the Minister of Colonization, (Fomento,) without which he cannot enjoy the aforesaid privilege.

Article 2. Every foreigner, or company of foreigners, who shall buy a tract of land to found a colony, shall, with their colonists, be exempt for ten years, counting from the day on which the papers of purchase are signed, which they themselves may impose; but they must present, within a year, the plan and survey of their possessions to the Minister of Encouragement of Colonization (Fomento) under the penalty of losing the privileges granted in this article.

Article 3. The foreigners comprised in the preceding articles shall enjoy, for a further period of five years, all the privileges therein granted to them; at the expiration of that time, they show that the number of Mexicans employed in their colonies or lands, is not less than one-third part of the entire number of laborers or colonists therein.

Article 4. They shall not pay, for two years, any duty on imported goods, nor internal duties of any description on articles that come consigned for the use of the colonists, or for the working of their lands. Should any merchandise coming from Europe, thus introduced for the use of the colonists, be circulated in commerce, it shall be subject to confiscation.

Article 5. All colonies founded in accordance with the preceding articles—the object being to encourage foreign immigration—shall be entitled to dispose freely of the municipal funds which they may produce, and the authorities shall not interfere with the administration of the same.

Article 6. The inhabitants of the colony thus formed—in what belongs to the fulfillment of the privileges conceded by this law, and the privileges mentioned in the Constitution of the Republic—shall, for a period of two years, enjoy the same rights which they would enjoy in their respective nations, or the nation of the owner of the property to which the great number of the colonists belong.

Article 7. All owners of farms (finca rustica) and colonists remain entirely subject to the laws of the nation in all the points not explicitly determined in this law, with the reservation of the terms specified in the preceding articles.

Palace of the Federal Government, in Mexico,
March 31, 1861.

BENITO JUARES.

RAMIREZ.

To the citizen Ignacio Ramirez, Minister of Colonization, Industry and Commerce.

God and Liberty!
Mexico, March 13th, 1861.

(TRANSLATION.)

Plácido Vega, Constitutional Governor of the State of Sonora, to the inhabitants thereof:

Know: That the State Congress thereof has directed to me the following decree:

No. 30. The people of the State of Sonora, represented by its Congress, decree the following:

Article 1. All public or vacant lands (Las terrenos y aguas baldias) and water in Sonora are the property of the State. One half of them are dedicated to protect national and foreign immigration, and to constitute a branch of the public revenue (erario publico).

Article 2. Every immigrant or company of immigrants coming with capital to settle in Sonora will receive, free of charge, the quantity of land necessary for the colony he or they may establish, with no other expense than that of the survey.

Article 3. All foreign immigration will be exempt from duties and taxes of any kind, and from military service, for five years. Foreign immigrants will, moreover, enjoy the privilege of establishing their own government and municipal legislation, provided they do not oppose the general laws of the State.

Article 4. The Government will issue the most proper and positive orders, so that immigrants will not be molested, or embarrassed by the anticipation of the fiscal laws, and from the time that they enter the State until they arrive at the place where they may establish their residence, and during the term of their residence, they shall be protected and favored by the local authorities, when such favor and protection may be required.

Article 5. The inhabitant of the State who thus cultivates and gathers within his property an hundred bales of cotton, of twelve arrobas (300 lbs.) each; one hundred arrobas, (25 lbs. each) of coffee or of sugar, shall receive a bounty of three thousand dollars, to be drawn from the State Treasury, in preference to other demands.

The Government will provide for the most complete execution of this law, and direct that the unoccupied lands (tierras baldias) within the district of Mazatlan be first surveyed.

Communicate this to the Executive for publication and fulfillment.

Hall of Sessions of the Congress of the State,
Mazatlan, 15th January, 1862.

FRANCISCO CORTEZ, Deputado Presidente.

FRANCISCO J. ARAGAN, Deputado pro Secretario.

JOSE Y ALADES, Deputado pro Secretario.

Wherefore, I order that to be printed, published and circulated for exact observation.

Port of Mazatlan, Jan. 16th; 1862.

PLACIDO VEGA.

(Seal.) FRANCISCO FERREL.

DR. CHAS. H. TOZER.

WOULD most respectfully inform his friends and acquaintances and those afflicted that he has removed his place of business from the City of Sacramento to San Francisco, where he can be consulted, and where they will receive the best of care and be sure to have a PERFECT CURE.

Charges moderate.

Private consultations without fear of molestation.

Office hours from 9 A. M. to 5 P. M.

Consultation Free, both personal and by letter.

STREET RAILROADS

IN SAN FRANCISCO.

NOTWITHSTANDING THE FACT THAT IN THE EASTERN CITIES Street Railroads have worked their way into public favor, until they have been conceded, not only a necessity, but a great public necessity, the subject of such enterprise is a new one in this State, and must necessarily receive that opposition which ignorance and self interest always raises against innovation.

I believe, however, that this enlightened Legislature is equal to the requirements of the times, and willing to concede to the citizens of San Francisco the advantages of the cheap and popular mode of conveyance furnished by Street Railroads.

As regards the bill that is now before the Assembly, it is a substitute for Assembly bill Nos. 25 and 103, inking the two parties one. It proposes to start from Davis and Vallejo streets, along Davis to Clay, up Clay to either Battery or Sansome street, provided the grantees can agree with the parties now having franchise on those streets; but if no agreement can be made with these companies, then we propose to run along Front to Rush street, provided the consent of two thirds of the property holders along said street can be procured; and in case their consent cannot be obtained, then the bill proposes to run through Davis to Pine, up Pine to Front, along Front to Rush along Rush to Dupont, along Dupont to Post, along Post to Stockton, along Stockton to Geary, along Geary to Taylor, along Taylor to Market, across Market to Simmons, or Sixth street, along said Simmons or Sixth street to Brannan, along Brannan to Brannan street bridge, with a branch running out either Turk or Geary streets to Steiner or Scott streets, along Steiner or Scott streets to Geary, out Geary to Lone Mountain Cemetery. Gentlemen will see that this route does not interfere with any other route heretofore granted, and every man must admit that no route so much needed as this; it enables the merchant, mechanic, and laborer, who live in the outskirts of the city, to come in and out at their pleasure, at a reasonable rate of fare; it also enables parties traveling to and from the city, to reach most of the principal hotels at the small charge of five cents; besides, it secures the stranger from the many man-traps, that so many have fallen victims to; it also enables the friends of those whose remains repose in Lone Mountain and the new Catholic Cemetery, to plant and water flowers over their graves, who are now debarred from so doing by the inconvenience of reaching the spot.

This bill has been published in most of the city papers, and no protest from any of the property holders has been presented against it, nor has any one attempted its defeat, except those who are actuated by motives of personal hostility against some of the grantees named in the bill. It is of the utmost importance to the public that the bill should pass. It accommodates the public with cheap and convenient means of traveling. It proposes to line been proven in the Eastern cities that along routes of Street Railroads property has advanced in most cases over 100 per cent., and I think no man in this city would say that this road will not advance the property over 500 per cent. in the outskirts of this city. If this be the case, it becomes the duty of members of the Legislature to examine the subject, and if they find these facts, they should see that this bill becomes a law; but if, on the contrary, they should find that there is any thing in the bill not for the public good, they should strike it out.

Gentlemen should remember that though this is a private bill, and private parties are to be benefited by it, it is also a great benefit and convenience to the public; they should also remember that it requires a large amount of capital to complete an enterprise like this, and they cannot be expected to enter into any such enterprise without a reasonable expectation of making it pay. Corporations never build any great works for the public good. The grantees are required to give a bond of thirty thousand dollars for the completion of the road within two years after the passage of this bill. The cry of private bills, by those who are always on hand, ready to black mail any parties who have sufficient enterprise to enter into such undertaking, should not have any weight in such matters, but if it is found to be for the benefit of the public as well as the grantees, then it is the duty of the Legislature to pass such bills, and let San Francisco stand in the march of improvement side by side with the Eastern cities, which have established Street Railroads as the great popular mode of conveyance.

JOHN P. ZANE.

WANTED.—A copy of the Patent Office Reports

(Mechanical) for 1857.

A Day in the Mines

On Friday last we laid aside our pen to take a tramp among the hills, and look wise over an exhibition of geological specimens, the nature and value of which we were as profoundly ignorant of as the average of miners. When near the New York House, we struck off from the road to a point where we found a Mexiana with the pick and shovel, uncovering what he assured us was an extension of the Columbia ledge now opened and paying ninety dollars to the ton. At the point opened the ledge is said to be about thirty feet in width, and the rock pronounced *micha vano*, by Jimmie from Mexico, a man more competent to judge than ourselves, in such matters. This claim has been named by the holder the O K, and certainly think it is not a misnomer. "The boys" nt the Columbia assure us that the reported sale for the claim for the sum of forty thousand dollars was a gross misrepresentation. They not only have not sold, but have had no intention of selling; they say they are working men and cannot afford to keep their ground at a higher price than any speculators can afford to pay. We like both their spunk and good sense, and sincerely hope that they may never have occasion to regret the rejections of the overtures that have been made to them and at ninety, or fifty dollars a ton, we are confident they acted wisely in declining the sale. Immediately before the Columbin, a Mr. Flemming has opened a ledge, which he has named Crystal Palace. As yet he has sunk but about six feet, and from a bare trace of quartz, the ledge has increased some four feet in width. From some two quartz the broker rock, we panned out a handsome prospect of fre gold—we hardly know what amount, but enough to give the claim a market value of ten dollars per foot. When we considered the small amount of labor performed, and a very slight opening made, it must be allowed that the price indicates a degree of confidence exceedingly gratifying to the holder.

The Winnamucca was next visited. We found the boys sinking a shaft for the purpose of thoroughly prospecting this claim. The Secretary authorized us to say that the rock would pay eighty dollars to the ton. Such being the case, those who have laughed at the holders in the Winnamucca may have cause to cry hee-haw they are not the butt of a similar joke. Adjoining Winnamucca is the Robin Hood; this company have a shaft down some fifty feet, and the ground is held at fifteen dollars per foot. We are not informed what the rock is paying, but we judge from the price of the feet here, that the boys have a good thing. Besides those mentioned, many other claims are being prospected in the new district, all with fine prospects. In fact many good judges think that a second Gold Hill has been discovered, and we predict that before the summer passes a town will spring up rivaling anything on the canon. In this belief the ground has been located for ranch purposes, and we presume that city lots can be purchased at reasonable rates. The thing is certain, if the mines prove as rich and extensive as the indications promise, we would rather hold property in the new town than in some of the old ones. That they will so prove we are not prepared to say, but we should be very much surprised if the Dana and Columbia were the only good ledges that immediate vicinity.—Silver Age.

Who Discover Them?—The Oregon papers are discussing the question as to who discovered the northern gold mine which we hope will turn out to be of value enough to make the discovery to be a credit to somebody. George M. Evans writing to the Times thus settles the mooted question:

In 1849 I crossed the Siskiyou mountains, and being search of minerals partly, in California and Oregon, I discovered on the Yakima, John Day's and Des Chutes river, gold—yellow gold! In other places of Oregon, and Washington I found gold, silver, quicksilver, iron, copper, salt and coal. In 1854, in order to disclose the resources of Oregon, I published in the Oregon Weekly Times, in a weekly series of letters, commencing on the 10th of June and continuing until the 31st of December, articles on the mineralogy and geology of Oregon. I there pointed out the fact that gold and other precious minerals were existing in Oregon in paying quantities.

Silver Alloys.

The alloys with copper constitute plate and coin; by the addition of a small proportion of copper to silver, the metal is rendered harder and more sonorous, while its color is scarcely impaired. Even with equal weights of the two metals, the compound is white; the maximum of hardness is obtained when the copper amounts to one fifth of the silver.

For silver plate, the French proportions are, 9 1/2 parts silver, 1/2 copper; and for trinkets; 8 parts silver, 2 copper. Hardest silver solder, 4 parts fine silver, and one part copper; this is difficult to fuse, but is occasionally employed for figures.

Hard silver solder, 3 parts silver, and 1 part brass wire, which is added when the silver is melted, to avoid wasting the zinc.

Soft silver solder for general use, 2 parts fine silver, and part brass wire. By some few, 3/4 part of arsenic is added to render the solder more fusible and white, but it becomes less malleable; the arsenic must be introduced at the last moment, with care to avoid its fumes.

Silver is also soldered with tin solder, (2 tin, 1 lead,) and with pure tin.

Silver and Mercury are used in the plastic metallic stoppings for teeth.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

FRIDAY.....APRIL 18, 1862

The MINING AND SCIENTIFIC PRESS is published at the State Capitol building, Rooms 23 and 24, corner of Battery and Washington streets San Francisco, Cal., by

J. SILVERSMITH, Editor and Proprietor.

At Fifty Cents per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING, Designs of every description—Buildings, Sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates. PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

Patent Matters.

Since the short space of six months, about the time we entered upon this new branch of profession, in connection with the enterprise of our PRESS we have been the means of procuring a number of Patents for valuable machines and implements, which for their utility and novelty favorably compare with those of any country. The emoluments resulting from these patent grants must eventually prove of the most lucrative revenue to the inventor.

In mining machinery we have particularly progressed and improvements are constantly being perfected, in this particular California has furnished some of the best inventions of the age, of these we have a few for illustration and will be presented to the reader soon. There are some inventors in all countries who are narrow minded enough to withhold their discoveries from the public,—to such we have a word to say:

By keeping your invention to yourself you deprive your fellow beings which by virtue of right in the progress of art and science belongs to them. That you would be amply rewarded and receive just tribute for your inventive genius, you thereby lose. That you would be protected by sufficient laws against infringement if you brought your invention before the public, are weighty facts for your non-communicative disposition, hence, upon reflection you will make your application for letters patent through the office of the "Mining and Scientific Press"—which is the only office in this State. The first Government fee is only \$15—prepare a neat model of one square foot and leave us to attend to the rest. Inventors in this State have amassed fortunes from inventions, and the field seems not exhausted. Mexico, Nevada Territory, California all are eager to avail themselves of the most approved machinery that will work their minerals and ores, in which they have scarcely made a beginning. In manufactures California is making rapid strides, and many improvements in machinery have appeared. We do not require the personal attention of the inventor, if he will send us merely a sketch with such a description as he is able to give, we will prepare his petition and application, specification, drawings, etc. in regular form in which we have great experience. We do not confine ourselves to obtain patents merely in this country but through our connection in England, France, Russia, Germany, are also enabled to obtain patents there, in the shortest possible time. Our knowledge of the French, Spanish, German, and Italian languages enable us to prepare the papers which will go direct to the Bureaux, without the extra charges of translation. We have all the late enactments, amendments, rules and regulations pertaining to each country, and any information required at our hands respecting inventions are gratuitously imparted.

Association for Iron Mining and its Manufacture.

By the incoming Steamer of the 25th inst. from Mexico, we shall have all the particulars, papers and authority from the parties interested and the Government Grant, for establishing blast furnaces and machine works in the State of Durango, Mexico. We have taken some trouble to convince a few of our leading manufacturers of the immense advantages resulting from the formation of such Company, and not a few objections have thus far been entered, but we still opine that as an investment no better or paying project has thus far been offered to California.

The mineral wealth of Mexico is proverbial and the demand of machinery for working the ore will be like wheat for our daily bread.

To the Citizens of this State.

The publisher of this journal being desirous of making the PRESS a paper of utility and interest to the people of this State, therefore, please take notice that from this day on, we will publish a business directory; namely, of such who will take two lines for their business card at the rate of 50 cents per month, to each of which advertiser we will send the PRESS free of charge, a paper exclusively devoted to the mechanic, mining operations and agricultural interests of our Pacific States. Containing matter of highly interesting and useful, but more than allusive, and to the practical artisan invaluable. Mr. Steinhardt our general business agent, will in due time call upon every business man here for their cards—Gentlemen! we ask your kind aid in this matter, for furthering your interests; and you can with this trifle enable us to lay before you a journal which has been struggling hard for the progress of our Home Manufacturers, Mechanics and Laborers, and perpetuate the good name the PRESS has attained for promoting these laudable objects.

VALLEY ACADEMY.—Select day school for pupils of both sexes, located on Mission street, between Second and Third streets.

What Virgil has said of the Romans. *Condere Romanam gentem, erat tanta molis*, to build up the Roman nation, was a work of great magnitude applies fully to the American republic. And the foundation of this grand work is the education of the coming generation; any effort that can advance this great national cause, is worthy of and deserves the highest acknowledgment and patronage of the public at large.

Since the earliest time of California, Dr. H. Bien has been connected and identified with the cause of education in this State, and he has won amongst his friend a high reputation as a teacher and a student. The above institution, under his supervision is one of the best and most flourishing in the State. The course of study is a combination of the European and American systems; discipline and rules of school are strict yet parental. No sectarian interference, although high moral principles are inculcated. The locality and the school rooms are not excelled in this city for ventilation. The terms of the establishment are most liberal, and the school is within the reach of all who desire a proper, useful and thorough education of their children.

Southern California—Its Mineral Wealth.

Our much esteemed cotemporary of the "Southern News" says the following:

As it is a well established fact that Southern California is immensely rich in all the minerals of the world, and which must at some future day be unmasked and developed, we will enumerate a few of the points at which mining has commenced, and too, which must necessarily depend upon Los Angeles as their headquarter for supplies, etc., and through which place most of the products of the mines must pass to the principal marts of the East. As much incredulity yet exists abroad, and even here in our vicinity, in relation to their extent and value, it may be considered a wild speculation to even allude at this time to facts which must take place sooner or later. Nothing can be done until capital seeks occupation; at the present time occupation of every character is seeking capital—hence the delay, and in this only.

First is the Coso and Esmeralda mines, where very rich discoveries have been made, and extensive preparations are in progress for work. The above districts, we believe, lie in the same direction from Los Angeles; that of Coso, where extensive mining operations are far advanced, is only one hundred and eighty-nine miles distant, and has the best and nearest outlet by way of this place, and a good natural road which is unobstructed for the whole year. At the above named place there are some four or five quartz mills in successful operation, with a number in progress of erection. The country, for the entire distance to Coso, has the appearance of a mineral bearing country; at several points good placer diggings have been discovered, which on being prospected are found to pay well. Those in the vicinity of Mono Lake have produced a large amount of dust during the past year. In the vicinity of Mono Lake paint springs, with a variety of other mineral substances, which eventually will be brought into use, abound. The report of the party, of which Mr. Chichester, of this city, was a member, shows the above region to be very rich in minerals, etc. The entire mountain range between the lake and sea coast reveals fresh indications to every prospector or traveler.

Next is the Soledad and Tehachepe mining districts, both of which are situated in the direction of Coso; that of Soledad canon being about sixty miles from Los Angeles. At this point a thorough work in mining has commenced; prospects and tests have been made which produce astound-

ishing and most satisfactory results. In Tehachepe Valley mining has become a permanent business, and a large amount of gold has been taken out during the past year. Between Los Angeles and Soledad, is the placers of Rock Creek, San Francisquito Canon and San Fernando, which are very rich, but cannot at present be worked to advantage for want of water.

The next is the Kern River mines, which lie in a north-westerly direction. These mines have been prosperously worked for several years, yielding a large amount of gold which has always found its way through our city, and from which most of the supplies for these mines have been taken.

Next in order, as we proceed in a south and easterly direction from Los Angeles, is the San Gabriel and Santa Anita mines. The first named has for the last three or four years sustained a large mining population; although no "big strikes" have been made, a paying business has been carried on with great benefit to our city and vicinity. The Santa Anita mines are rich but have been worked at too great disadvantage to pay well.

The gold mines of San Diego county are rich and mostly undeveloped, with the exception of the quartz mines on Wetherby's ranch, which have been successfully worked during the past two years paying richly for the investment required to carry on the work. The tin mines, which are also in the above named county, at Temescal, a distance only of some seventy miles from Los Angeles, have been ascertained to be as rich and extensive as any tin mines known to the world; they are at present locked up, but must ere long be made to yield up the hidden treasure which in itself, would be sufficient to make California the richest State on the Pacific coast even if there were no other mines known. Tin exists in large quantities in San Diego county, in the direction of both San Diego and Fort Yuma. Prospects of silver have also been obtained at several points in the same direction, and which demonstrate clearly that rich silver mines are yet to form a prominent feature in the mineral wealth of that locality. Indications of copper are also apparent everywhere.

We now come to the Holcombe Valley mining district. Here rich gold quartz lodes exist almost without number; many of them have been worked during the past two years by the rough and primitive arrastras, yielding as high as sixty dollars to the ton. This district only awaits occupation by capitalists to outdo all others in the State. The first experiments with machinery by Messrs. Mellus, Nichols, Tibbets & Co., has, we believe, clearly demonstrated this fact. We may as well say that the mountains which surround the valley are one mass of mineral, as they contain but little substance which does not prospect well—much of the float rock paying from eight to ten dollars to the ton. Much placer gold is found and worked to great advantage. Cinabar, Galena and many other varieties of minerals are found in the San Bernardino mountains; fair prospects of silver have also been found, to say nothing of the innumerable tar springs found in Los Angeles and adjoining counties, which are beginning to come into notice amongst other mineral substances; together with marble, alabaster, coal etc., etc.

We will close with a glance at the Potosi or Colorado mineral district, the extent of which is unknown. Several companies have been engaged for the past year in prospecting silver veins and have met with much encouragement. The Amagosa gold quartz vein; which is very rich is also situated in the Colorado mining district. All the above mineral resources are situated within reach of Los Angeles, and by nearer and better routes than any other point; hence Los Angeles must in time be their great feeder in a commercial point of view.—News

Notes and State Items.

TO MINE IN SONORA.—Articles of incorporation of the "Germania Mina Prieta Company" were yesterday filed in the office of the County Clerk. The Company is to mine for gold, silver and other metals in the State of Sonora, Mexico. Their capital stock is \$40,000, divided into eleven shares each of which may be converted into eight subdivisional shares. The present Trustees are Aug. Hoelscher, Jac. Brewer, C. Berghoefer, Jac. Wieland Wm. Hartman.

COMPRESSED COAL.—An invention has been brought out in England by which the immense amount of coal dust that accumulates and becomes a great incumbrance at the mouth of the coal mines, is made available fuel, and thus rendered valuable. The dust is first conveyed through a washing machine for the purpose of disconnecting it from any stony particles which it may contain. It is then subjected to a steady heat, until its bituminous parts are rendered quite soft, after which it is passed into a moulding machine, where it is compressed to lumps, and thus made capable of transportation. A ton of the compressed coal occupies one-third less space than the ordinary coal, and is therefore cheaper for carriage. An apparatus is provided for extracting the gases from the coal during the pressure, ingeniously opening out the air passages at each stroke, which would otherwise become choked by the bitumen. Breakages in the presses are prevented by resting the levers of the main press upon the ram of the hydraulic press, the safety valve of which is loaded only to the extent that the strength of the machine will bear. Each machine, which is inexpensive in construction, is capable of making twenty tons per day, an estimate cost of twenty-five shillings

SUMMARY OF MINING NEWS.

To Miners and Mill Owners.

We respectfully request all persons interested in the Mines, in Quartz Mills, or in any prospecting expedition; also the Recorders of the different mining districts to forward to us at all times, such information concerning the condition etc., of the mines and hills in their vicinity, and description of localities, as they may think will prove interesting or useful to the public for publication. Recorders of mining districts will oblige by sending us their address.

CALIFORNIA.

Sierra Co.—The "Democrat" from this county has the following excellent account from the southern port:

I perceive by your weekly issue a great deficiency of mining news, and I presume that all the mining camps in our county are much like ourselves—have a plenty of snow, and no water—hard times and but little money. Nevertheless, I propose enclosing a few straws from our camp, thinking them not out of place. My communications have lately been few and far between, owing to the recent storms.

Great damage has been done to some companies, and some have not been able to resume their work any length of time. The Morning Star Camp has been taking out good pay, so I was informed by one of the members. Claims are rated at from \$1200 to \$1500 per share. The "United" Company, which has heretofore paid rich, has again started to run the main tunnel towards the back lode, or centre of the ridge. The Live Yankee Company has not taken out much pay since Christmas. The floods caused their shaft to cave in, and they could not work until the shaft was newly timbered. This company has its new tunnel now in over 300 feet, which is 25 feet deeper than its first—expects to reach gravel at the end of 500 feet, which will cut off an incline of 120 feet. Should the Live Yankee ground pay according to the prospects, they will be valuable claims, and last to work for ten years. On Peavine Flat adjoining Balsam, is the Steamboat Company—formerly called the Union. These boys are in 500 feet. Expect to strike gravel next week. Should this company get good diggings, together with the Empire, which is now in 600 feet, with the Mint and Gem Companies, good times will be expected here this summer. Our town is yet small, but nearly laid out. There are nine dwelling houses, one saloon, and a neat cottage which is graced by a handsome lady, her husband and two fine children.

At Chips, but little has been done with the great hydraulic pressure to which I once time ago alluded to; and as Mr. Patrick Hayes can not get water to operate on the bank, he puts in what we term his derick licks on Cunningham's billiard tables, for the whiskey, at a double discount. The Mammoth Company has been taking out good pay—figures not known to me. As soon as the boys get their diggings they go around and make things lively, and should the American company's lead and Quartz Mill be sold, as I perceive from an advertisement in your last issue, and the property be purchased by a good trustworthy company and go to work rightily, I think there is but one ledge in Sierra county or this State will exceed it for richness; and with a little additional machinery, a better mill can not be found in California.

Thus the anticipations of our business men run high, that work will be plenty and chips put on its former appearance as in olden time.

Good rocker diggings are found on the river banks. The old tailings and boulders have been turned out, and the deposit on the banks is fresh from the upper banks and banks. Men who have tried with a pan say there are places where \$10 a day can be made with a rocker. The Chinamen have been at work this week, going out the bars and banks, and working with a zeal that would indicate success. It is hard, that while Americans are complaining of lack of work, these fellows should have good diggings right in town; but it is not a flattering comparison of enterprise that Chinamen work and say nothing, while the others growl and do nothing.

For some months there has been but little rock crushed by Hill & Moody's arrastra; the workmen have been employed running a new drift and cutting down deeper into the ledge. They have commenced again to take out rock, and we understand it is richer than any ever before found—and the ledge wider. This ledge promises to prove us good as the Sierra Buttes.—Sierra Democrat.

Trinity Co.—Opposite Mill creek, near the mouth of Greenhorn, mining is being carried on with good success, in the ridge running along the eastern part of Yreka valley. A small ditch, six miles long, leading from Cottonwood gulch, supplies water. Messrs. Greenhorn & Co. are making as high as \$5 per day, and calculate in a few days to average \$50 per week to the land. They are under the advantage of receiving supply of water, on account of the small streams giving overabundance of water to the ditch, causing breaks. Good prospects have also been found on the Shasta valley side, but there is no fall for sluices.—Yreka Journal.

The great floods of the past winter have done considerable good as well as much damage in Trinity county. Whilst most of the improvements along Trinity river have been either swept away, or much damaged, the large amount of water rushing down this stream has washed heavy deposits of earth off many hills and bars, leaving the nothing for the miner to do when the water falls to normal stage, but to wash the pay dirt. In some instances the entire bed of the stream has been changed, and the old channel is nearly dry, saving to the miner, during the coming summer, much labor and expense in damming and fluming. We have talked with miners residing along the river at different points for a distance of sixty miles, and they all have about the same story to tell; that Americans and Chinamen are busy everywhere, especially at points where the water has bare the bed rock on the banks, and is sufficiently low for them to get at it.

We have heard of many instances where men are making as high as an ounce per day, working with a rocker, just picking up and washing the bed rock, left bare by the floods. Many river miners express the opinion, notwithstanding the great destruction of dams, flumes and mining machinery on the river, that there will be more gold taken from the Trinity the coming Summer and Fall, than in any one of the past ten years.

As to the dry river and the diggings, there never has been so favorable a season for working them since the discovery of gold in California. While we have no big strikes to chronicle, we have no failures to record; the miners are all busy and cheerful, the very best evidence that they are doing well.

Mr. John Brechtow, while washing up some old tailings from John Mammel's old claim, in the western part of town, found a solid piece of pure gold weighing five ounces and eleven dollars. He has also been making over \$5 a day in washing up tailings. This piece was no doubt thrown out at the first washing, on account of being covered with cement.—Yreka Journal.

The flume across Trinity river above Evans' Bar, is nearly completed, and the water will be turned in a few days. The flume at that point was carried off by the flood of Dec. 1st.

Tuolumne Co.—The "Courier" states that the merchants on Main street, Columbia, have been for some time past engaged in opening a ditch in front of their stores to drain their cellars, overwhelmed with rain in the recent floods. On examining the dirt thus thrown up, it has been found rich in gold—yielding, in some instances, as high as fifty cents to the pan. A large number of men have for several days been washing out this dirt, all along the stables of Messrs. Mullap up to Jackson street.

Contra Costa Co.—Quite an excitement was caused in this neighborhood says the Contra Costa "Herald," a few days since, by the reported discovery of gold in places where the rain had washed the soil in the vicinity of Mount Diablo. A number of specimens of the genuine article were freely exhibited, which we were assured came from that locality. Claims were asked off and sanguine expectations indulged in by those early in the field.—Stockton Weekly Journal.

Sacramento Co.—All around and in the town of Folsom mining is prosecuted with vigor and satisfactory results. The earth seems to have received a new supply of gold particles from the heavy rains of the past few months. Digging which were never considered worth a man's while to work, are now prospected and mined with most satisfactory results. The prospecting hope, of late, in the prospect in the hills, the hardy men who have for these many years toiled ineffectually in the bowels of the earth in search of what we all desire—a competency and a home.

NEVADA TERRITORY.

Humboldt.—At the Humboldt mines, flour is worth 62 cts. per lb.; barley, 40 cts., on foot; bacon, 40 cts., and not over 50 lbs. in the market. Mr. S. M. Smith, and several others, leave Shasta valley about the 10th of May, freighting flour, grain, bacon, &c. They will go by the way of Squaw valley and pass by Fort Teck. Freight is 15 cts. per lb. from Red Bluff, and money can be made at 10 cts. hauling from Yreka, where the above articles are at least one half below Red Bluff prices. The distance from Yreka is about 300 miles, and a good road for easy teaming. The mines are said to be very rich, and more extensive than Washoe.

The "Territorial Enterprise" says the Florence Company, situated below the Gould and Curry claim, near Virginia City, has struck rock which assays \$1,200. To the south of the Florence, they have also struck a rich ledge within the past few days. Sneath & Clay discovered, last week, a rich quartz lead on Gold Flat Nevada county. The decomposed quartz prospects well, and gold is visible in every piece of solid rock taken from the ledge. Much attention has been given to quartz, of late, and many new ledges are being worked, much to the satisfaction of the owners.

The Winnemucca Company on the continuation of the Gov. Dana Lode, one mile and a half north-west of the New York House, have their shaft down 45 feet. They struck the ledge at a depth of 27 feet. The ledge is now about three feet high, and pitting to the westward rapidly. The metal in the rock is 11 1/2 lbs. thirty-five pounds of the quartz having washed out \$35 in gold. This claim is advantageously located—easy of access and has but few original owners.

The Colorado Territory News of recent date says that during the year 1861 nearly \$7,000,000 of Pike's Peak gold was mined at the U. S. Mint in Philadelphia, almost double the amount that found its way there the preceding year.

From late dated papers from Nevada Territory we glean the following intelligence:

The Pioneer Coal Company have forwarded to their mine a quantity of timber and stores. The mine employed brought back about three tons of coal, which found a ready sale at Dayton and Silver City, to the blacksmiths, at three cents a pound, and from those now using it, we are informed that the article is of a much superior quality to that brought into our city about six weeks ago. The same now being worked has increased to four feet in thickness, and the company intend supplying the Phoenix Mill Company at Silver City with coal next week, which will be the first to burn it in this country. Other mills will be supplied as rapidly as possible. We hope to see coal in general use before long, as it will have a wonderful influence on the future prosperity of our Territory.—Territorial Enterprise.

THE EAR AND CANNON FIRING.—Dr. Von Mosckzisker says that many of the injuries to which gunners and others are exposed by loud explosions may be obviated by saturating a piece of cotton wool in a solution of glyceric acid and belladonna—says about one ounce of glyceric acid to fifteen grains of belladonna, and place it in the ear as far as possible. This solution forms a coating in itself on the membrane; and with the addition of the cotton, protects the drum of the ear to the utmost extent. When the cotton is removed, the coating can be readily washed out by syringing the ear with a little warm water.

There is no doubt that numerous cases of ruptured membrane, with more or less permanent deafness, will be found among soldiery returning from campaign. Gunners—particularly those of the fleet—aware of the great danger to which the organ of hearing is exposed, plug their ears well with wool.

This precaution may somewhat diminish the amount of injury which would otherwise be endured; nevertheless, the wool as generally plugged in the ear, does not protect the membrane. The effect of position with reference to the gun is peculiar—those men who stand nearest the muzzle feel the report most, but those who are to leeward suffer more than those to windward. Some protection is afforded to the ear by keeping the mouth open when listening to heavy firing.

THE MOST POWERFUL GUN IN THE WORLD.—We are sure that none of our readers will fail to read the account, lately published, of the trial of the great Union gun. There have been guns made in Europe of much larger caliber than this, but none of them of sufficient strength to give any considerable velocity to the shot. This gun is twelve inches in diameter, and, being rifled, carries an elongated shot weighing 423 pounds—nearly, the same weight as the round ball of Rodman's fifteen-inch gun, which is 425 pounds.

The London Engineer, in speaking of the recent experiments at Shoeburyness, calls Armstrong's two hundred pounder the most powerful ordnance in the world; but the shot of the big gun at Fortress Monroe is more than twice as large, and the gun is consequently more than twice as powerful. These two guns, the twelve-inch rifled, and the fifteen-inch smooth bore, are the most powerful pieces of ordnance that have ever yet been made.

The introduction of iron-plated ships has made it very desirable for sea-coast defence to have enormous cannon, the shots from which would break the iron plates to pieces. But, until Rodman's improved mode of casting was invented, it was impossible to make cannon strong enough to bear the charges required to give effective velocity to balls weighing 400 pounds. These circumstances cause peculiar interest to attach to the trial of twelve-inch rifled cannon, and we are much pleased at being able to present so good a description of this trial.—Hunt's Merchant Magazine.

Mining and Mining Policy.

There is an evident disposition, in a certain class to take the management of the mineral lands of California out of the hands of the miners, by having them surveyed and sold by the Federal Government. While we acknowledge that there are a few good reasons to favor this policy, we assert that there are many against its adoption. Undoubtedly, if it were done, capital would seek investment in our mines more than it now does, and larger operations would be undertaken to develop their buried riches. But while we admit the desirableness of these results, we believe the same can be procured under our present system of management, without producing the odious effects which would surely follow the sale of the mineral lands.

It has been argued, and we think very reasonably, that their sale by the General Government will have the effect of creating dangerous monopolies, who would, by the power of capital, engross the profits of the mines, to the exclusion of the masses who now enjoy them. Many who are in favor of the new policy, scout the idea, and urge that monopolies are harmless, and that the dangers apprehended are all imaginary. In answer to all such, I would point them to our agricultural districts, where the peculiar beauties of monopolies can be seen in the unfortunate system of Mexican land grants.

But while we oppose putting too much power into the hands of capitalists, we believe liberal inducements should be offered to induce the employment of capital in the development of our natural resources. This is not done in the Columbia mining district and vicinity; but on the contrary, capital, instead of finding inducements offered for its aid, is actually driven away by our present mining laws, and in some instances, by the almost insane policy pursued by those miners who have thrown every obstacle possible in the way of enterprises which have resulted to their greatest benefit. In this, we allude to the wholesale persecutions which have been heaped upon the fluming companies, by miners along the line of the flumes. The Shaw's Flat, and the Wood's Creek fluming companies have both encountered the greatest difficulties from this source. In some cases they have been obliged to pay excessive damages, and in others, have had to turn their flume, and go around claims which have only been made valuable by the success of their enterprises. All this is wrong; and it is a wonder, while pursuing such a course, that we should be in the poor condition we now are.

It is not because our mines are worked out, that they pay so poorly, but it is in consequence of our present manner of working them. We are really working our ground by spoonfuls, when we should be rushing it off by acres. There is not a foot of soil within miles of Columbia, which, if properly worked, would not pay manifestly; and yet, here we are, poor with unbounded riches, and actually hungry while rolling in plenty.

We have in our hands the power to remedy this evil, and should apply it. Our greatest need, as every one in this vicinity knows, is a system of tail-raes and flumes which will enable us to work our deepest diggings advantageously. The great basin, in which our mines are situated, can easily be drained into the Stanislaus River, by driving a tunnel through Table Mountain, in the vicinity of Springfield, which has been found by actual survey to be the most favorable point for the commencement of such a work. From this point cuts can be made, and flumes laid, ramifying through the whole of our extensive mining district. Such a work could be made to drain not only our mines, but also those of Shaw's Flat, Union Hill, Wood's creek, Saw Mill Flat, and Yankee Hill, which are known to be very extensive and rich in gold, and are now so advantageously worked. In order to get these, we must modify our mining laws so as to give parties who invest their capital in them greater security from molestation. We must hold out inducements sufficient to warrant investments in such enterprises.

The inducements which we think should be held out are, that parties who make expensive cuts, tunnels, and flumes for the more thorough working of mineral grounds, should be allowed to hold more ground, than persons who do not invest in such enterprise, but take advantage of them after they are completed. The amount of ground thus allowed should be in proportion to the magnitude and expense of such works; which should be secured to parties making them by strict enactments. This would have the effect not only for inducing capitalists to invest in our mines, but it would prompt the miners to greater exertions in opening their claims properly, and would induce them to quit being that race of nomads which the Stockton "Independent" very properly calls them.—Tuolumne Courier.

On the 20th of December occurred an incident in the Big Tree Grove, which will create a sensation among voyagers and curious travelers who visited that place wherever the news may reach them in their wanderings round the world. The mammoth tree of that marvelous forest, Hercules, fell. This tree was by great odds the largest of the grove. Having a leaning towards the southwest of about ten degrees, the rains and snows loosened and softened the earth about his roots, so that they gave way to the immense weight and leverage pressing them upward; and Hercules, the mighty, who had braved the storms and rains of not less than twenty-five centuries, succumbed to the great deluge of Dec., 1861.

REAL ESTATE, COMMERCIAL AND GENERAL
AGENT,
NO. 420 MONTGOMERY STREET, BETWEEN
SACRAMENTO AND CALIFORNIA.

BUILDING LOTS, STORES, HOUSES AND RANCHES FOR SALE AND TO LET.
MONEY to loan on Bond and Mortgage, or on approved securities.
RENTS collected, and all other business appertaining to the above, attended to with promptness and dispatch.
ALL orders from the interior, for the purchase of goods or Merchandise promptly attended to.

PROPERTY FOR SALE!

TWO LOTS on Bush Street suitable for Homesteads, or Business purposes, 22 feet 6 inches each, by 67 feet in depth.
TERMS: Part cash, balance on time.
ALSO Choice Homesteads on Folsom and First Streets.
LOT on Folsom street, near the northeast corner of First street, 25 feet by 87½ feet in depth.
ALSO, Lot on First street, near the northeast corner of Folsom, 25 feet by 87½ feet in depth.
ALSO, desirable property for investment, on S. E. corner of Second and Mission streets, one hundred feet square, covered with eight Brick Stores, all rented to the first of next May.
ALSO, Pier No. 3, or Lot 649, on Stuart street, running through to East street. Street piled, capped and plankled. Rented to the first of May, next.
ALSO, Lot No. 589, on the southeast corner of Market and Main streets 45 feet 10 inches on Market, and 137½ on Main street.

FRENCH MERINO SHEEP!

BUCKS and FWES, FULL BLOOD. Also, 1,000 Ewes half blood French Merinos. Also, French Merinos, three-quarter blood. This Spring's Buck Lambs can be had by applying before the first of May.
ALSO, 2,500 acres of School Land Warrants of the 1st issue.
ALSO, Five Brick stores in Sacramento City, on Front street, opposite the Railroad and Steamboat Depot, between K and L streets. Part cash; balance on time.
ALSO, one Lot in Sacramento, 40 feet front by 150 feet in depth, on Front, between J and K streets.
ALSO, one Brick store in Sacramento, 24 feet by 60 feet in depth, on J street, between Front and Second streets.
ALSO, one valuable Lot for business, 50 feet square, on the corner of J and Front streets, Sacramento City.
ALSO, Two Farms, of 300 acres each, on the Feather River, opposite the town of Nicholas, 26 miles below Marysville. This property will be disposed of on long credit and low interest, with one quarter paid down. April-24.

A. S. HALLIDIE.

H. T. GRAVES.

A. S. HALLIDIE & CO.,
WIRE SUSPENSION BRIDGE BUILDERS,
and Manufacturers of
PATENT WIRE ROPE.

WIRE Suspension Bridges of any span and capacity erected, and material furnished.
Having been constantly engaged in the erection of Wire Suspension Bridges and Aqueducts for some years past, we are fully prepared to do such work satisfactorily at a low figure, and to guarantee PERMANENCY.
Parties who are about erecting bridges will find it greatly to their advantage to give us a call before deciding to build wooden structures, as the recent floods throughout the State have proven them to be wholly unsafe and unreliable. A number of our wire suspensions are now in use in different localities throughout the State, no one of which has been in the least affected by the freshets.
WIRE ROPE, for mining and ferry purposes, manufactured of any length and size required, being cheaper and better than hemp.
Scales of weights and strength with prices, furnished on application to the manufacturers. Send for a circular.

Ml. A. S. HALLIDIE & CO.,
 412, Clay street, San Francisco.

Woodworth & Brown's
CELEBRATED PIANOS.

THE UNDERSIGNED HAS JUST RECEIVED twelve Pianos from the above celebrated firm.
Many years' experience have convinced me that these Pianos have no superior, in Europe or America, in regard to tone, touch or durability; and I can bring sufficient proof of this, by parties in this city, having used Woodworth & Brown's pianos for the last ten years, and will testify that these pianos still retain their original tone and touch.
Mr. Chickering, of Boston, was himself the assigner of the Diploma, giving Messrs. Woodworth & Brown the First Premium at the Massachusetts State Fair.
I have specimens on exhibition at the Art Gallery of Messrs. HAMILTON & LOVERING, Montgomery street, between Sacramento and California streets, where purchasers can buy a First Class Instrument, for a little more than New York cost.
I invite those wishing to have a superior piano, to examine the same before purchasing elsewhere.
REMEMBER! HAMILTON & LOVERING'S Art Gallery, Montgomery street, between Sacramento and California.

REAL ESTATE PURCHASED AND SOLD, LOANS NEGOTIATED
THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard, work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.
This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines: metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miner's Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer: together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alta California.

A BOOK FOR THE MINERS.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide; a Compendium of most valuable information for the Prospector, Miner, Geologist, Mineralogist and Assayer; together with a comprehensive glossary of technical phrases used in the work." It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its Character; and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press" of San Francisco. The title of the work the Miner's Companion and Guide, and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[Sac. News.

A VALUABLE WORK FOR THE MINERS.—Our thanks is due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a

lossary, giving the definition of all the terms made use of in the work. m of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout our mining towns for its merits and lucidness. We earnestly commend it to those who are practically interested in bringing to light from Mother Earth the hidden treasures.—[Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the five years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual loss was only \$4,520, being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,239. Under Mr. Hempstead, the total expenditures for five years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. Retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of this State at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths. fine. 3cts per oz
" from 300-1000ths. to 750-1000ths fine. 7cts "
" " 750-1000ths to 950-1000ths " .14cts "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce ½ per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
 301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, ½ per ct. gross value of silver for making bars; also when gold is contained ½ per ct. on gross value of gold for coining. Refining charges in purchases.

BARs SOLD FROM REFINERY.

\$1 21cts. per standard oz. ½ per ct. gross value to be deducted for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. ½ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard oz. ½ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$12 per standard oz., and is exempted from the coinage charge unless deposited for silver dollars, in which case a charge of ½ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver registers as most congruous with the physical aspects of the material; but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rate and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to its extensive establishment, we can confidently announce to the public that we now have
the Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.
We make to order, and have for sale, High and Low Pressure Engines, Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp shoes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Mulay, and Circular Saw Mills; Shingle Machines, cutting 25,000 per year, and more perfectly than any now in use. One of these shingle machines is seen in operation at Metcalf's mill in this city.
We also have for sale, and are making, the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved, in fact, all kinds now made.
Quartz Screens, of every degree of fineness, made of the best Russia Iron; Wheels and Axes of all dimensions; Bulding Fronts; Horse Powers; Cut Mills; Roller Fronts; Wind Mills; of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.
Steamboat work promptly attended to.
Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GOLDARD & CO

SPECIAL NOTICE.

Highly Important Invention in Dentistry.—Dr. D. STEINBERG has leave to announce to the citizens of this city, that letters patent for his valuable improvements in mechanical Dentistry were granted him on the 12th of November last.

This invention consists in the application of GUM ENAMEL to gold plates for artificial teeth, and are acknowledged to surpass all others in use, for their beauty, style and exactitude of fit; their weight compared with others, is less but are far more durable by the addition of the gum enamel. Specimens of this valuable invention may be seen and examined at the dental office of the undersigned, No. 648 Washington street, near Kearny. Great care and attention is devoted to the perfect fitting of teeth. Teeth extracted by the benumbing process.

Practical Dentists,
648 Washington st., near Kearny.

REMOVAL OF THE DEAD

From Yerba Buena Cemetery.

AS THE DEAD IN YERBA BUENA CEMETERY WILL BE REMOVED IN a short time by the authorities, those having relatives or friends there wish disinterred, are informed that I have the most complete registry in existence of graves in that Cemetery, having added to my own records, by purchase, the book of the late City Sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges.

Everything requisite for Funerals supplied at the shortest notice.
NATHANIEL GRAY,
General Undertaker, 641 Sacramento street, corner of Webb,
Between Kearny and Montgomery.
Established in 1850. m8-1f

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefitted by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planners will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2.80

Names can be sent in at different times and from different Post-offices

Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Lock Box 537, P. O.

Room 24, (formerly) U. S. Court Building, Corner of Washington streets, San Francisco.

WHILE YOU HAVE THE MONEY,

MAKE SURE OF A HOME!

NEVER HAZARD THE LAST DOLLAR!

To Cariboo and Salmon River Miners, and all others who wish to purchase LOTS in San Francisco with a PERFECT TITLE:

The undersigned will sell Building Lots for from \$10 to \$200. Also, 50-vine Lots and entire Blocks of the most beautiful gardening lands in the city and county of San Francisco, on the line of and AT THE WEST-END DEPOT of the SAN FRANCISCO AND SAN JOSE RAILROAD. Persons desiring to view a few dollars, or hundreds, or thousands of dollars, would do well to call on the undersigned, AS HE DEALS ONLY IN LANDS WITH A PERFECT TITLE, to wit: those held under

A PATENT OF THE UNITED STATES!

Persons residing in the interior, or who are about to go to the Cariboo or Salmon River Mines, can purchase this property and leave it without any fear of adverse claims or titles springing up in their absence.

The undersigned will, if desired, give his personal attention to the assessing, paying of taxes, etc., on all lots purchased from him, and will forward to each non-resident purchaser his tax receipts, free of all cost save the actual amount of the taxes.

Office—No. 19 third floor of Nagle's Building, (south-west corner of Merchant and Montgomery streets.) HARVEY S. BROWN. m8 1f

Removal!

F. A. HASSEY, Notary Public, and REAL ESTATE AND HOUSE AGENT, has removed from No. 406 to No. 423 Montgomery street, adjoining H. Heutsch's Bank, near Sacramento street. ap9 1f

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour ter arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and ye simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco,
Ogden & Wilson. }

Caveats and Patent Applications.

We are enabled through our legal connection at Washington and European Patent Bureaus to obtain Letters Patent for inventors and discoverers on this Coast, WITH LESS EXPENSE, and GREAT ECONOMY of TIME, than any other firm in the United States. Those requiring our services will please address us by stating the nature of their invention with a sketch, or drawing, thereof, also a model if possible. The Government fees are as follows:

On every application for a design, for three years and six months, \$10; on every application for a design, for seven years, \$15; on application for a design, for fourteen years, \$30; on every caveat, \$10; on every application for a patent, \$15; on issuing each original patent, \$20; on filing a disclaimer, \$10; on every application for a reissue, \$10; on every additional patent granted on a reissue, \$30; on every application for an extension, \$50; on the grant of every extension, \$50; on appeal to the commissioner from examiners in chief, \$20; on every appeal to the judges of circuit court, D. C., \$25.

Illustrations and Engravings.

WOOD ENGRAVING.—This office undertakes the preparation of Illustrated Catalogues and Circulars for Engineers, Agricultural Implement Makers Hardware Dealers, Jewellers, Printers, Patentees, and other kinds of Wood Engraving; and, from considerable experience in Illustrating Mechanical Journals, can insure accuracy of detail both in the Drawing and Engraving. This is secured by employing professed Mechanical Draftsmen in the preparation of the Wood Blocks.—Drawings taken from Photographs—Estimates furnished.

Address JULIUS SILVERSMITH,

Patent Solicitor, State Capitol Building, cor. Wash. and Battery, San Francisco, Cal.

Palmer's Improved

KNOX' AMALGAMATOR.

We give herewith a neat and exact illustration of highly creditable and scientific improvements recently attached to this amalgamator. Knox' Pans have heretofore stood in high repute for doing good work, but with the addition of Mr. Palmer's improvements few can even compete therewith. It is a well known fact that heat applied to mercury for amalgamation, materially augments its volume, besides imparting chemical auxiliary which expedites or hastens the process, and that more successfully and perfect than otherwise. To effect therefore this purpose, Mr. Palmer of the firm, composing the "Golden State Foundry," on First street has attached a false bottom, or what may be termed a steam chest. The pipe seen underneath the pan supplies the steam chest with steam, another pipe alongside serves as an escape for the water or as an exhaust pipe. Another improvement which Mr. P. has effected, facilitates the transportation of these pans very much. The rim of the pan forms one complete piece and readily admits of packing across the mountains; the bottom and steam chest form another portion; thus the weight is divided and many difficulties obviated, when these pans arrive at their destination both parts are so fitted together as to form a perfect joint, and may be bolted or screwed together. For a full and complete description of this amalgamator we refer the reader to our work entitled the "Miners Companion & Guide" on page 193.

PROF. G. A. SOTT'S CONCERT.—On the 24th inst. Mr. Scott takes a benefit at Platt's Music Hall. The arrangements of a concert are said to eclipse all heretofore given, the entire musical talent of this city have nearly all volunteered. Instrumental, vocal, and operatic music, of a varied description will form one of the strongest programmes ever offered, no doubt the house will be densely filled.

We are glad to notice that Mr. L. Simon who is the present proprietor of the extensive Furniture Factory on Fremont near Market street has now a number of mechanics employed, and the establishment is again in full blast, as it should be. The style and quality of household furniture they make exceeds those imported, and the cost of the same appears considerably less, than that shipped to this country. Dealers should bear this in mind.

In our last issue some gross mistakes occurred in the spelling of the name of a correspondent from Virginia City. The communication was from Mr. Wm. Hutchins, Secretary Pioneer Coal Company. The proofs were neglected to be read.

THE LICK HOUSE.

The annexed neat illustration of this splendid edifice represents another architectural triumph in this city, which boasts now of as many fine structures as any city in the Union. The drawing of the building as well as the engraving were executed at this office, and altogether presents one of the neatest miniature sketches ever presented through this journal. The interior of this House is still undergoing the finishing process of plastering.

Messrs. Heuston, Hastings & Co. have recently rented the corner store fronting on Montgomery and Sutter streets, which will be open by the 21st April, and it is their intention to open one of the finest stocks of goods in the way of clothing and furnishing articles ever exhibited in this State. This firm has been extensively engaged, and favorably known throughout this State as first class Clothiers and Tailors, having an immense warehouse in Sacramento, and up to within a few months, had an extensive establishment in Marysville. Their house in New York bears the reputation of the best manufacturers of clothing, and these transmit all the latest styles and fashions of wearing apparel to their houses in California, so that the same may appear simultaneously with the Atlantic States and Europe. The enterprising managers in this city of this firm, have made an excellent move, and we doubt not their harvest will be rich. We wish them success in their new premises.

PIONEER FURNITURE MANUFACTORY,

Fremont Street, between Mission and Market.

THE UNDERSIGNED BEGS LEAVE TO INFORM DEALERS IN FURNITURE and the public in general, that he has opened a large Factory at the above place, and is at any time prepared to manufacture all kinds of

FURNITURE

At the Lowest New York Prices!

And respectfully solicits City and Country Dealers to give him a call.

L. SIMON,
Pioneer Furniture Manufactory,
Fremont street, bet. Market and Mission.

Homesteads Cheaper than Proposed under the Shafter Bill.

UNDER THE PROVISIONS of what is known as the Shafter Bill, it is proposed to sell the city title to homestead lots for twenty-five to two hundred dollars each.

The undersigned will sell homestead lots within the limits of the city, and miles nearer to the business centre than many of the lands covered by the Shafter Bill, and place the party in immediate possession of the same, without present trouble or prospective lawsuit, for from \$10 to \$20 each. THE TITLE is absolutely PERFECT, being a Spanish Grant, finally confirmed and patented by the United States. The Shafter Bill respects this title: the city authorities respect it; the District Court and the Supreme Court of the State, as well as the District Court and Supreme Court of the United States respect it; besides the TITLE HAS BEEN FOREVER QUIETED BY A FINAL DECREE AND JUDGEMENT AGAINST THE CITY so that there is not even a cloud or shadow upon it. Whoever purchases one of these lots will buy a lot, not a lawsuit.

VOL. V.

SAN FRANCISCO, FRIDAY, APRIL 25, 1862.

NO. 7.

Grover & Baker Sewing Machine Company's Manufactory.

We present on this page an engraving of the Manufactory of the Grover & Baker Sewing Machine Company, located at the corner of Waltham and Washington streets, Boston. This immense establishment, one of the largest and most complete manufactories in the United States, is five stories high, three hundred and twenty feet in length, and finished throughout in a massive and substantial manner. Four hundred men are employed within its walls, and one hundred in shops outside, preparing cabinet work and castings. The employees have lucrative work the year round. A large number of them have been in the Company's employ for the best nine years, and very many have acquired a handsome property. In this long term of service in a business in which the best mechanical skill and the greatest accuracy are necessary, these artisans may be said to have become complete Grover & Baker men—thoroughly understanding the delicate and beautiful machinery on which they are employed, and taking a becoming pride in the manufacture of the household treasures that are to be seen in the homes of our citizens in every section of the country. A visit to the Grover & Baker manufactory is a treat to the curious and a lesson to the thriftless. The long work-rooms, bright and cheerful, resounding with the hum of labor, and peopled with intelligent and industrious workmen; the many different departments, each skillfully joining link to link until the product of their labor is ready to be welcomed to the overjoyed housewife; the order, liberal expenditure

and true economy which are apparent throughout the mammoth building; all impress the visitor with the perfectness of the management and completeness with which even the minutest details of the business is carried on.

The extent of the demand for the Grover & Baker sewing machines and the immense resources of the Company, can be only partly seen by the inspection of the Boston manufactory; for this is but the spring from whence flows the supplies for the thousand-and-one depots established by the Company in the cities, towns and villages of the Republic. A few days since we looked in their extensive warehouses on Montgomery street in this city. Mr. Brown the gentlemanly agent exhibited to us a new and improved Sewing Machine from the above factory. The simplicity and compactness of construction exceed now many in use. They keep upwards of 2000 Machines ready and on hand to fill any demand. In Mexico their sale has been greater than that of any other make, is partly caused by the peculiarity of its mode of working and its novelty of the stitch. By their machines the handsomest imposing and raised fancy work can be produced, which no other machine is capable of doing. In our next issue we shall give some scientific and interesting details of the construction and operation.

IMPORTANT TO DELINQUENT TAX-PAYERS.—By reference to an advertisement of the Tax Collector in our columns, it will be perceived that the tax-sale for delinquent taxes of the

years 1856-7, 1857-8, 1858-9, is soon about to take place. It will be remembered that this sale was advertised to take place very nearly two years since, but the sale having been then enjoined, the case was taken up to the Supreme Court, and has been recently decided in favor of the city. After the sale was enjoined, the entire delinquent list was placed in the hands of J. B. Felton for collection, and we understand that it is the intention of this gentleman very soon to apply to the Courts to have all the injunctions in these cases dissolved, and then to legally enforce payment. In all cases of delinquency on personal property, and in very many of those on real estate, suits will be commenced in the name of the Collector.

The Legislature of 1861 passed an Act authorizing the receipt of city bonds and other demands against the city in payment for a portion of the taxes, and the Collector has obtained a stay of proceedings in order to give delinquents an opportunity to settle before having incurred the expenses of a suit of their property. Parties neglecting to avail themselves of this privilege will have no cause for complaint in reference to costs incurred by such neglect.

DR. JAMES M. HILL.—We take great pleasure in welcoming this gentleman—one of our earliest pioneers—to this city, he is the inventor of a highly valuable apparatus for separating ores of every description, of which we shall in a few days prepare an illustration and present his novel method to our readers.

Goddard & Co.—Pacific Foundry.

The annexed illustration presents one of our best Foundry establishments on this coast. Some of the most gigantic and extensive machines for various purposes have been manufactured and erected in these works. During the winter months the whole premises were remodeled, enlarged, and additions made, new floors laid; and additional tools and materials for executing finished work. The area covered by their Foundry and Machine Works is as large as any of those in the Atlantic States, and their facilities for doing work, in a workmanlike manner, and expeditiously far superior than heretofore. The proprietors are the inventors and makers of several celebrated inventions, such as quartz mills and amalgamating pans, (see elsewhere a description and illustration.) Those who have contracts for building machinery would do well to consult them, knowing them to be reliable, and faithful in carrying out and completing all they may undertake to do.

Scientific Intelligence.

PHYSICS AND CHEMISTRY.

Temperature of the Atlantic Ocean compared with that of the air from Southampton to Havana, (In a letter from M. Andres Poey to Prof. Silliman, dated Havana, Dec., 1861.)—In my passage from Southampton to Havana from the 3d to the 22d of November last I undertook at the suggestion of Mr. Charles Saint Clair Deville, for the benefit of science, to observe, at different hours of the day, the temperatures of the waters of the ocean and of the air, also the prevailing winds, the barometric pressure, the atmospheric electricity and polarization, the saltness of the sea, etc. Observations of this kind in the open sea are of great interest both to pure science and navigation. It was by the collation of thousands of observations, made principally by American navigators, that Maury has reduced to fourteen days the voyage from any point of the United States to South America. It is also by the same method that Mr. C. Saint Clair Deville has pointed out the poles of heat and cold which eddy in the sea of the Antilles, where the curves are concentrically inflected. At present I will simply call attention to the influence which shoals exert upon the thermic state of the ocean. These phenomena were first observed in 1776 by Blagden, confirmed in 1789 by Jonathan Williams, and more recently by Humboldt, John Davy, Peron, and others.

The depression of temperature near the land reveals to the navigator the existence of a shoal, or the proximity of a coast which is yet invisible. Williams frequently observed a depression of temperature to the extent of 4° C. while he was at least three hours distant from any point of danger. The statement of Humboldt that "the proximity of a sand bank is indicated by a rapid decrease of the temperature at the surface of the sea" is not only interesting to the philosopher but important to the safety of navigation. The use of the thermometer should not of course lead to the neglect of the lead, but many experiments show that variations of temperature, measured even by imperfect instruments, give warning of danger long before the vessel comes upon soundings. In such cases the cooling of the water may lead the pilot to heave the lead where he would expect the most perfect security.

On the specific heat of certain elements.—Regnault has determined the specific heat of one or two elements not previously examined, and has revised that of others which

were somewhat uncertain, in consequence of the impurity of the specimens which he employed in his earlier researches. The results are most conveniently exhibited in a tabular form.

	Spec. heat.	Atomic heat.	Equivalent.
			0-100.
Magnesium,	0.2499	37.49	150
Lithium,	0.9408	75.61	80.37
Osmium,	0.83113	38.11	1244.2
Rhodium,	0.05803	37.84	652.1
Iridium,	0.03259	40.19	1233.2
Manganese,	0.1217	29.55	325.0
Nickel,	0.1108	38.78	350.0
Cobalt,	0.10620	37.17	350.0
Tungsten,	0.3342	38.43	1150.0
	Spec. heat.	Atomic heat.	Equivalent.
Silicon (cryst.),	0.1774	46.92	266.7
Silicon (fused),	0.1660	31.29	177.8
		15.64	88.9
Boron (amorphous),	0.4053		
	0.3483		
Boron (graphitoid),	0.3598		
	0.2352		
Boron (cryst.),	0.2722		
	0.2253	34.1	146
	0.2574		

From the above table it will be remarked that all the elements examined obey the law of Dulong except lithium and silicon. Regnault repeats in connection with lithium a suggestion long since thrown out by him, that the true equivalent of lithium is 40.38, and consequently lithia should be written L₂O, just as for similar reasons potash and soda should be written K₂O and Na₂O. In the case of silicon the author remarks that no one of the three equivalents which have been proposed for this element corresponds to the law of Dulong, but that if we adopt for silica the formula SiO₂, which requires the equivalent 222.3, the atomic heat becomes 39.12, and comes within the ordinary limits of experimental error. Regnault does not adopt this view, but simply calls attention to the subject. It is possible, certainly, that silicon exhibits the same anomalies in its different forms as carbon. The specific heat of boron is doubtless somewhat too low, and the different experiments do not agree well with each other.

For several years past the following old English receipt for tempering tools—in general use at Sheffield—has been peddled all over the Eastern States at \$25 for shop rights, and considered by the buyers cheap at that. We now furnish it to our subscribers, together with the PRESS, for one year, for the low sum of four dollars! To each gallon of soft water add 1 oz. spirits of nitre, 1 oz. white vitriol, 1 oz. sal ammoniac, 2 oz. alum, 8 oz. salt, 1 pint common oil. Heat milk picks a dark cherry red and cool the ends quick in the above composition. For wood tools, heat a dark red and cool to a dark copper color. For taps and dies heat a light red and cool to a bluish yellow shade. For springs, heat a black red and cool to a dark blue. Razors, knife blades, and all thin tools can be tempered in the above without drawing the temper.

BETTER THAN CARIBOO.—The miners at Nelson Point are making a good thing at brevising. A certain miner for the first day's work took out \$8; second day, \$15; and on the 4th day realized \$23. All average from \$5 to \$20 per day. As soon as the water recedes further, the chances will be still better.

GREAT REDUCTION
IN PRICES.

FREDERICK KESMODEL,

Cutler and Surgical Instrument Maker

517 KEARNY STREET,

Between Jackson and Washington streets,
SAN FRANCISCO.

RECEIVED a diploma at the Fair of the Mechanics' Institute, September 1858, also in Sacramento in 1861 for California made Cutlery.

The attention of those afflicted with HERNIA, or Rupture, or any one interested, is called to his new method of fitting and adapting Trusses to the different cases. It is a well known fact that there has as yet been no system of fitting Trusses. There are many different styles which have proven good in many cases, but they are all uncertain and cannot be relied on, and all severe cases are altogether useless. The following are some of the advantages I claim for these Trusses above any and all others: First—The Pad formed on the parts to be compressed by taking a plaster cast. Second—Having a correct model, it enables me to make the Pad of any desirable material, such as horn, ivory, etc. Third—The Pad is so adjusted to the spring that no movement of the body will move or displace it. There are many other advantages. Examine and judge for yourselves.

FREDERICK KESMODEL,
Inventor and Patentee.

TO EMIGRANTS TO MEXICO.

THE UNDERSIGNED DESIRING TO INFORM THE RESIDENTS OF California that he has been appointed Commissioner of Immigration, to act in California, for the State of Sinaloa, Mexico.

The inducements held out to emigrants intending to become permanent residents in the State of Sinaloa, are of the most liberal character; the fertility of the soil, the well known richness and extent of the mineral regions, and the salubrity of the climate, render this beautiful country a very desirable region for immigration.

Referring to the laws of the Supreme Government of Mexico, and those of the State of Sinaloa, published herewith, the undersigned would state that, in addition to the privileges conceded by those laws, he has instructions from the Government to insure to the persons first arriving in Sinaloa tracts of beautiful land in the immediate vicinity of the city of Mazatlan.

Full powers and instructions, under the seal of the Government, can be seen at the office of the undersigned, where he will be ready to impart to persons wishing to emigrate full information as to the mineral and agricultural resources of the country, and the great advantages which will accrue from the cultivation of sugar, cotton and tobacco.

ALFRED A. GREEN, Emigrant Commissioner.

Office Union Hotel Building, corner of Merchant and Kearny streets.

(TRANSLATION)

DEPARTMENT OF STATE.
Office of Encouragement of Industry, Commerce and Colonization.

The citizen Benito Juarez, Constitutional President of the United States of Mexico, to all the inhabitants thereof:

Know, That by virtue of the ample powers with which I am invested, have thought proper to decree the following:

Article 1. Every foreigner who alone, or in company with other foreigners, buys a tract of land for agricultural purposes, or to establish a farm, (finca rustica), shall be exempt for two years—counting from the day on which the papers of purchase were signed—from all taxes or contributions of any kind; being required, however, to present a plan of his possession to the Minister of Colonization, (Fomento), without which he cannot enjoy the forasaid privilege.

Article 2. Every foreigner, or company of foreigners, who shall buy a tract of land to found a colony, shall, with their colonists, be exempt for ten years, counting from the day on which the papers of purchase are signed, which they themselves may impose; but they must present, within a year, a plan and survey of their possessions to the Minister of Encouragement of Colonization (Fomento) under the penalty of losing the privileges granted in this article.

Article 3. The foreigners comprised in the preceding articles shall enjoy, for a further period of five years, all the privileges therein granted to them; if, at the expiration of that time, they show that the number of Mexicans employed in their colonies or lands, is not less than one-third part of the entire number of laborers or colonists therein.

Article 4. They shall not pay, for two years, any duty on imported goods, nor internal duties of any description on articles that come consigned for the use of the colonists, or for the working of their lands. Should any merchandise coming from Europe, thus introduced for the use of the colonists, be created in commerce, it shall be subject to confiscation.

Article 5. All colonies founded in accordance with the preceding articles—the object being to encourage foreign immigration—shall be entitled to dispose freely of the municipal funds which they may produce, and the authorities shall not interfere with the administration of the same.

Article 6. The inhabitants of the colony thus formed—in what belongs to the fulfillment of the privileges conceded by this law, and the privileges mentioned in the Constitution of the Republic—shall, for a period of two years, enjoy the same rights which they would enjoy in their respective nations, or the nation of the owner of the property to which the great number of the colonists belong.

Article 7. All owners of farms (finca rustica) and colonists remain entirely subject to the laws of the country. In all the points not explicitly determined in this law, with the reservation of the terms specified in the preceding articles.

Palace of the Federal Government, in Mexico,
March 31, 1861.

BENITO JUAREZ.

To the citizen Ignacio Ramirez, Minister of Colonization, Industry and Commerce.
God and Liberty!
Mexico, March 13th, 1861.

RAMIREZ.

(TRANSLATION.)

Placido Vega, Constitutional Governor of the State of Sinaloa, to the inhabitants thereof:

Know: That the State Congress thereof has directed to me the following decree:

No. 30. The people of the State of Sinaloa, represented by its Congress, decree the following:

Article 1. All public or vacant lands (Los terrenos y aguas validas) and water in Sinaloa are the property of the State. One half of them are dedicated to protect national and foreign immigration, and to constitute a branch of the public revenue (erario publico).

Article 2. Every immigrant or company of immigrants coming with capital to settle in Sinaloa will receive, free of charge, the quantity of land necessary for the colony or they may establish, with no other expense than that of the survey.

Article 3. All foreign immigration will be exempt from duties and taxes of any kind, and from military service, for five years. Foreign immigrants will, moreover, enjoy the privilege of establishing their own government and municipal legislation, provided they do not oppose the general laws of the State.

Article 4. The Government will issue the most proper and positive orders, so that immigrants will not be molested, or embarrassed by the anticipation of the fiscal laws; and from the time that they enter the State until they arrive at the place where they may establish their residence, and during the term of their residence, they shall be protected and favored by the local authorities, when such favor and protection may be required.

Article 5. The inhabitant of the State who thus cultivates and gathers within his property as hundred bales of cotton, or twelve arrobas (300 lbs.) each; one hundred arrobas, (25 lbs. each) of coffee or of sugar, shall receive a bounty of three thousand dollars, to be drawn from the State Treasury, in preference to other demands.

The Government will provide for the most complete execution of this law, and direct that the unoccupied lands (terras validas) within the district of Mazatlan be first surveyed.

Communicate this to the Executive for publication and fulfillment.

Hall of Sessions of the Congress of the State,
Mazatlan, 15th January, 1862.

FRANCISCO CORTEZ, Deputado Presidente.

FRANCISCO J. ARAGAN, Deputado pro Secretario.

JOSE VALADES, Deputado pro Secretario.

Wherefore, I order this to be printed, published and circulated for exact observation.

Port of Mazatlan, Jan. 16th; 1862.

STREET RAILROADS

IN SAN FRANCISCO.

NOTWITHSTANDING THE FACT THAT IN THE EASTERN CITIES Street Railroads have worked their way into public favor, until they have been conceded, not only a necessity, but a great public necessity, the subject of such enterprise is a new one in this State, and must necessarily receive that opposition which ignorance and self interest always raises against innovation.

I believe, however, that this enlightened Legislature is equal to the requirements of the times, and willing to concede to the citizens of San Francisco the advantages of the cheap and popular mode of conveyance furnished by Street Railroads.

As regards the bill that is now before the Assembly, it is a substitute for Assembly bills Nos. 25 and 103, making the two parties one. It proposes to start from Davis and Vallejo streets, along Davis to Clay, up Clay to either Battery or Sansone street, provided the grantees can agree with the parties now having franchise on those streets; but if no agreement can be made with those companies, then we propose to run along Front to Bush street, provided the consent of two thirds of the property holders along said street can be procured; and in case their consent cannot be obtained, then the bill proposes to run through Davis to Pine, up Pine to Front, along Front to Bush along Bush to Dupont, along Dupont to Post, along Post to Stockton, along Stockton to Geary, along Geary to Taylor, along Taylor to Market, across Market to Simmons, or Sixth street, along said Simmons or Sixth street to Brannan, along Brannan to Brannan street bridge, with a branch running out either Park or Geary streets to Steiner or Scott streets, along Steiner or Scott streets to Geary, out Geary to Lone Mountain Cemetery. Gentlemen will see that this route does not interfere with any other route heretofore proposed, and every one must admit that no route is so much needed as this; it enabled the merchant, mechanic, and laborer, who live in the outskirts of the city, to come in and out at their pleasure, at a reasonable rate of fare; it also enables parties traveling to and from the city, to reach most of the principal hotels at the small charge of five cents; besides, it secures the danger from the many man traps that so many have fallen victims to; it also enables the friends of those whose remains repose in Lone Mountain and the new Catholic Cemetery, to plant and water flowers over their graves, who are now debarred from so doing by the inconvenience of reaching the spot.

This bill has been published in most of the city papers, and no protest from any of the property holders has been presented against it, nor has any one attempted its defeat, except those who are actuated by motives of personal hostility against some of the grantees named in the bill. It is of the utmost importance to the public that the bill should pass. It accommodates the public with cheap and convenient means of traveling. It proposes to keep in repair a large portion of the streets through which it runs, and it has been proven in the Eastern cities that along routes of Street Railroads property has advanced in most cases over 100 per cent., and I think no man in this city would say that this road will not advance the property over 500 per cent. in the outskirts of this city. If it is the case, it becomes the duty of members of the Legislature to examine the subject, and if they find these facts, they should see that this bill becomes a law; but if, on the contrary, they should find that there is any thing in the bill not for the public good, they should strike it out.

Gentlemen should remember that though this is a private bill, and private parties are to be benefited by it, it is also a great benefit and convenience to the public; they should also remember that it requires a large amount of capital to complete an enterprise like this, and they cannot be expected to enter into any such enterprise without a reasonable expectation of making it pay. Corporations never build any great works for the public good. The grantees are required to give a bond of thirty thousand dollars for the completion of the road within two years after the passage of this bill. The cry of private bills, by those who are always on hand, ready to black mail any parties who have sufficient enterprise to enter into such undertaking, should we have any weight of the matter, but if it is found to be for the benefit of the public as well as the grantees, then it is the duty of the Legislature to pass such bills, and let San Francisco stand in the march of improvement, side by side with the Eastern cities, which have established Street Railroads as the great popular mode of conveyance.

Eureka, Trinidad and Crescent City, Touching at Mendocino.

The Steamship

OREGON,

FRANCIS CONNER

Commander

Will leave Folsom st. Wharf for the above Ports,

THURSDAY.....APRIL 24, 1862,

At 4 o'clock, P. M.

For freight or passage apply on board, or to HOLLAY & FLINT, Proprietors.

Office 407 Washington street, opposite the Postoffice.

Bills of Lading will be furnished to shippers of cargo. No others will be signed.

State of California, City and County of San Francisco. Chas. C. Bemis, U. S. Inspector of Boilers for this district, being duly sworn, says that on the 21st day of February, 1862, at the request of Messrs. Holladay & Flint, he tested the boilers of the steamship "Sierra Nevada" and applied a hydrostatic pressure of 24 pounds to said boilers per inch, and that they withstood the pressure without any trouble, difficulty or evidence of weakness; that being the usual pressure to boilers of that description, no severer test was applied or deemed necessary. From my inspection of her machinery and boilers, I pronounce her entirely safe and seaworthy so far as that department is concerned.

U. S. Inspector of Boilers.

Sworn and subscribed before me this 31st day of March, 1862.

E. V. JOICE

Notary Public.

[L. S.]

Government of British Columbia and its New Mint.

BRITISH COLUMBIA with its reputed mineral wealth is in the wake and march of progress, as well as other States on the Pacific. The impetus it has received from gold-seekers abroad within a short space of time, have given it such importance as to cause the British Government to explore and develop the country, and endow them with every convenience for establishing useful institutions. An important feature which has been established in that Colony is that of a Government Branch Mint. Some months since F. G. Claudet Esq., of New Westminster, B. C., was deputed to secure the necessary machinery for coining purposes, accordingly he repaired to this city, and ordered from the Vulcan Foundry a number of presses, mills and other implements for smelting and refining purposes. Two series of dies were ordered and finished in artistic style by Mr. Albert Kuehner, an expert die sinker on Washington street. The coin thus far is limited to 20 dollar and 10 dollar gold pieces, we give herewith a faithful and correct illustration of the \$20 coin; the \$10 coin have precisely the same figures and impressions as the 20 dollar, only being smaller in diameter.

The coin of these denominations are of the same size as that of the United States. Commercially, this new medium of exchange will be of material advantage to the merchants of British Columbia, Vancouver Island, and those of the United States. We look upon this coin as so much bullion; since the Government of British Columbia will refree their gold for coinage, and bring it to a certain standard, so that if it is shipped to this city or New York, it may be coined over without a loss to the shipper, receiver or consignee. The alloy of silver contained therein will pay for the coining and wastage.

The people of British Columbia will no doubt be materially benefited by having a ready medium, which will facilitate and advance their business relation. As a Government enterprise it will give stability and character to that colony, and place it foremost in the colonies of Great Britain. But a short while since we visited New Westminster, a town with enterprising citizens had erected a number of buildings in the midst of a romantic and picturesque forest, probably just before that was occupied by some Indian tribe, and now forms the Colonies' Government Seat, with Lieut. Gov. Col. R. C. Moody, Commander of the land forces, and Chief Commissioner of Lands and Works.

FROM WALLA WALLA.—We were shown a letter from Walla Walla, yesterday, dated Feb. 28, written by D. J. H. Harris, to W. H. Rhodes, Esq., of this place, from which we extract the following items in reference to the hard winter, mines, &c.:

Mr. Harris says that they have been snow-bound at Walla Walla, for two months, no letters or papers had been received since the 22d of December, and the thermometer had been as low as 26° below zero, and had stood for weeks at a time 20° below. At the commencement of winter, it was estimated that there were 50,000 head of stock in Walla Walla valley—now there is not 1,000 head, they have all perished in the snow, even chickens have been frozen to death. Men who were rich in stock last fall, now have scarcely a cow or horse left. Provisions are scarce, and held at an enormous price. Where the emigrants, who are rushing for the mines are to get provisions we know not. It is not here, and cannot be bought at any price, and there are now 1500 or 2000 persons at Salmon river, with only a supply for some two months on hand, and the flood in Oregon has destroyed almost the whole surplus stock and grain—yet thousands of thoughtless ones will come without money and without grub, and on foot at that. There must be unheard-of suffering. The best of gold mines cannot create provisions where it is not. As far as the mines have been tested they are no doubt fabulously rich; the only question is, how extensive are they? The quality of gold is poor—I sold to-day 11 oz at \$11 an ounce, for coin. In trade it is worth \$12, and may advance to \$13.—Independent.

WANTED.—A copy of the Patent Office Reports (Mechanical) for 1857.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

FRIDAY.....APRIL 25, 1862

The MINING AND SCIENTIFIC PRESS is published at the State Capitol building, Rooms 23 and 24, corner of Battery and Washington streets San Francisco, Cal., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STEREOTYPING and ELECTROTYPING, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

Discovery of Coal Oil.

About twelve miles from Oakland a coal-oil bed has been discovered, from which large supplies can be derived for burning purposes. This will probably cause a great reduction in the prices of illuminating oil, as soon as the natural liquid can be properly refined for domestic use.

In connection with this discovery we have thought proper to give a few facts relating to coal-oil, or Kerosene, as it bids fair to become an important commercial article.

The pure coal-oil, as imported here, by Stanford Bros., is a colorless liquid, burning with a clear, steady light, free from fetid smells, and easily distinguished from a spurious article by its non-explosive character. It has long been known under the names of naphtha, and mineral petroleum, and is very different in its qualities and constitution from the factitious tar derived from the igneous decomposition of pit coal. It is the result of the action of water upon carbonaceous matters in the mineral strata. In many places the flow of coal-oil is accompanied with a large discharge of water, upon which it floats, and from which it is skimmed. It is found in various portions of Asia, Europe, North America, and the city Panama, Italy, is, we believe, lighted with it at present. We have heard that wells have been sunk in the neighborhood of San Pablo, Contra Costa County, which yielded an abundance of oil, and that a wealthy company is placing the proper apparatus there to receive and refine the natural flow. If this be true, it will add another source of profit to the State. Unfortunately, as an article becomes useful and therefore, popular, many spurious imitations are made of it; and coal-oil is no exception to this rule. Several accidents have happened recently from this cause, and families should be always on their guard against dangerous imitations.

THE OPERA.—The people of this city have been treated to a "smack" of opera recently at the Metropolitan. Strenuous efforts are made by the leading performers to render their performances creditably, but we are afraid they lack the "physic" the material is weak; the attendance at the house are limited. *Mairtha* will soon be brought out. *Lucia* and *somnambula* have been performed alternately and *La Favorita*. When the Biancis arrive a good operatic company may be established we hope so, it would be well patronized.

The American is well attended; Mr. Leighton is a favorite with our public, and she is bound to please.

The Application of Science to the Useful Arts.

BY PROF. WM. B. RONGERS.

It is well to apprehend clearly the meaning of the terms, *Art and Science*; and by *Science* is meant those principles and laws of Nature which are eternally true, and whose universal tendency is to cause material substances to be changed in their conditions or the reason fixed, in just the same degree and kind under the same circumstances. Man's inference of rules from these laws of Science, for the accomplishment of certain specific results, is the basis of *Art*; and these rules when grouped into their relative classifications are called the *Arts*, while the application of them by the workman, to the substances whose form or other mechanical properties are thereby modified, constitutes the so-called *Practical Arts*. Often some of the ruder or more necessary *Practical Arts* seem to be conducted without the knowledge of the principles and laws of Science, or even the rules of *Art*; but although these principles, laws and rules do not always appear in use, they can never be transgressed with

impunity, and a definite and real use of them is often made, after they have become well known, when the unreflecting little suspect it. And it is always true that he who understands these laws and rules is the most successful artisan, and the more serviceable, practical man; and it is likely that he alone will make any considerable advance in the application of his art to the wants of man.

On the other hand, thoughtful observation of the details of practised arts and the operation of Nature, enables one in this philosophic habit to deduce rules from an extended comparison of similar processes, and from these rules of *Art*, laws and principles are frequently evolved, which in their new application to other departments of human labor, develop new practical *Arts*, important thereto. While the philosophers of old ignored the details of the *Practical Arts* as insignificant,—as they naturally enough appeared when singly considered,—the great means of progress in both the physical Sciences and the *Arts* was unused, and the attempt to snatch at great laws and to spring at once to the secret powers of Nature was but poorly rewarded. Hence has risen the popular distrust of Philosophy and Science, but since the time of Bacon this futile method has ceased to be the basis of the search for truth, and its consequent prejudice to the cause of human investigation should have died in the popular mind long since. Bacon's method of *Induction*, or the inference of rules, laws and principles from the testimony of multitudes of well observed facts to the same point, let in the great light needed by the philosopher, the scientist and the practical craftsman, and hence the enormous strides which Science and the *Practical Arts* have made during the last two centuries; indeed, if the metal sciences be accepted, *Art and Science*, in a wide sense, almost date their birth at this great epoch.

Thus it appears that Science is appropriately called "the handmaid of *Art*," and *vice versa*; they are coworkers, and go hand in hand up to the temple of knowledge and progress. Neither can go far, nor well, without the other; and the everlasting necessity gives dignity to the workman, who should respect Science, and humility to the philosopher, who must take counsel of the *Practical Arts*.

The weakness of those who decry the higher walks of Science becomes evident when we consider the important part they play in some of the most common and useful things. The map, for instance, that is necessarily familiar to every child at school, is a graphic product of the application of many scientific principles; all those employed in topographical and geographical surveying; and it is seldom remembered that every point of coast, mountain, river, lake and ocean depth, on an authentic map, is determined by the use of the fixed and most complicated instruments in the hands of profound mathematicians, or by the aid of their wonderful logarithmic tables,—instruments constructed in accordance with the laws of optics, mechanics and magnetism; and with geometrical knowledge all these are accurately drawn, and at last the map and then the atlas is ready for the scholar, the navigator, and the naval commander.

The pound weights and the yard measure are used by the merchant and builder, and the sight of them is so common as to lead us to forget the profound scientific principles, the knowledge of which enables civilization to profit by their immense utility. How is it possible for us to use the myriad weights we are obliged to trust to all over the globe? What insures their perfect equality in parts remote from one another? And with the wear and various exigencies of their changing conditions, how shall we determine their departure from the standard, when once determined upon, and make the necessary correction?—The principles of the pendulum were first discovered by Galileo. It was found that under the same circumstances a pendulum of a given length would always vibrate in the same time as the same length in any other quarter of the globe. Therefore, all pendulums vibrating in just one second of time, under similar circumstances of temperature and pressure are of exactly equal length. Now if it be agreed to call this $39\frac{1}{2}$ or 40 inches, by dividing this into as many equal parts we shall have our inch, or unit of measure. And if we agree that twelve of these shall forever be regarded as one foot, and three of these feet one yard, etc., we have our universal system of measures, upon which we can always implicitly rely! As a cubic foot of water at the temperature and pressure is of unvarying weight, whatever we agree to call that weight, becomes the unit of our standard in weights. But as the sublimest researches and calculations of the astronomer and mathematician were requisite to determine the measurement of time, it will be seen that our familiar weights and measures could not be used but for the aid of the most abstract science with which man is acquainted.

But as an instance in which purely scientific research, for no ulterior end has become in the most unexpected and singular way prolific of practical use, let us observe the progressive development of the present knowledge of polarized light. At first it was discovered that a ray of light instead of passing in a right line from point to point, has an undulatory motion like the waves of the sea; but that the undulations were not only up and down, and also from right to left, but in all conceivable direction obliquely or angularly to these: so that a ray in passing along traversed the line of a spiral. Thus far it was purely a scientific matter and valued for this alone. Next it was discovered that upon passing through a transparent medium denser than air the ray became flattened to a motion in a plane perpendicular

to the horizon, and this, too, was only a curious fact. Now it was found that upon projecting this flattened ray into liquids containing crystallizable salt, it became twisted in one direction, and with uncrystallizable ones, in the opposite way; and hence, by a simple experiment with a ray of light, whose phenomena were at first investigated to increase our knowledge in Science alone, the sugar refiner in his *Practical Art* of testing the value of any syrup, may at once know the amount of crystallizable sugar it contains and so estimate its exact value, or its worthlessness; and now as we sweeten our delicious cup of tea, we may know how directly the present scientific investigation may contribute to some of our most cherished every-day wants.

Another instance in which the practical turn of a purely scientific truth is seen, is in the case of gun-cotton. A chemist at first found a new and definite body by pouring nitric acid upon sawdust. Years after another experiment with woody fibre in a different form,—the cotton. Without changing the appearance, it had acquired a new property of explosiveness upon ignition. It was found of little importance in warfare from some cause and has never displaced gunpowder. But the investigator was not at all affected by any influence of utility; his object was only the search of new truth; and he continued his labors and at length ascertained that the new material, gun-cotton, would dissolve in ether, leaving a pure, colorless, limpid liquid, from which the cotton was again deposited upon the evaporation of the highly volatile fluid which had effected its solution. To-day, all over the civilized globe, the almost infinitely fine surface or web of this delicate fibre, as left upon the photographic background, is receiving the sun-pictured portraits of almost every individual in Christendom and all the scenery of beauty or grandeur, it may gratify the desire of man to delight his friends with, whether or not they ever leave their native town!

Perhaps the most remarkable service Science has rendered any practical *Art*, was to that of navigation. It was early observed that the most ancient astronomers erred in supposing the pathway of the moon to be circular or even exactly elliptical. But of what practical use is this information? None was thought of or cared for. Astronomers continued the study of the heavens, and with the most ingeniously constructed instruments, the most profound mathematical problems known in Science, the most unwearying search and study of centuries, learned the track of the moon's revolution, learned that of the earth in relation to the sun; and to what earthly use was all this accumulation of observations, of calculations and of voluminous records, which only the most recondite could read, and of which no one prophesied or thought, in relation to any practical service? Not a hearer of the lecture was there but was duly benefited through the assistance to civilization afforded by the power of the ship's officer to determine his longitude from the predicted position of the earth and moon and stars as seen at Greenwich. From his own observation he learns the direction of one of these and determines how much of the day is gone, or how long it will be till noon; and from his chronometer, which keeps Greenwich time, he ascertains the difference between the time of day where he is and at the observatory at Greenwich. And thus, by a reference to the tables of the Nautical Almanac and a simple calculation determines how many hours and the number of degrees of longitude his ship is east or west of the meridian of Greenwich.

The lecturer referred to the many known bodies of organic chemistry with regularly but slightly varied constitution, such as cane, fruit and vegetable sugars, and to the alcohol series and the benzole series, which bodies in the latter group, differ from one another by the progressive accumulation of two atoms of water only, yet being altogether distinct compounds. Of what practical use is the knowledge of all these similar products with most unpronounceable names? What, if in the investigation should lead to the direct use use to which it points and by the discovery of how to combine organic elements we could make prime alcohol or sugar or any other useful compound! Not that this result may be expected, but this is the apparent tendency and in these closely allied bodies a system is apparent.

By a variety of illustrations the lecturer showed the mutual dependence of the higher branches of learning and the pursuits of what is usually denominated practical life, and drew the necessary conclusion that neither can ignore the other, and that it should be the reasonable pride of the manual laborer to look for assistance and for pleasure to Science; and for the philosopher to find in the details of every-day life and the *Arts* which relieve and engross much of it, the elements of knowledge and power, or the means for the attainment of discovery of new truth.

In conclusion, reference was made to the political condition of the Country, and it was taken as an evidence of a well-founded love of learning, that so large an audience (the lecture-hall being crowded) was found capable of showing their interest in it, even while they carried in their minds and hearts so engrossing matters as now agitate the nation; and it was an evidence of the wisdom and patriotism of the people which recognizes that the permanent welfare of a Country is always dependent upon its progress in the knowledge of theory and practice,—in Science and *Arts*.

The proprietor of this journal desires one or two gentlemanly persons to act as solicitors or canvassers for this paper. Good wages allowed.

SUMMARY OF MINING NEWS.

To Miners and Mill Owners.

We respectfully request all persons interested in the Mines, in Quartz Mills, or in any prospecting expedition; also the Recordors of the different mining districts to forward to us at all times, such information concerning the condition etc., of the mines and hills in their vicinity, and description of localities, as they may think will prove interesting or useful to the public, for publication. Recordors of mining districts will oblige by sending us their address.

CALIFORNIA.

Nevada County.—The "Enterprise" says that the Union Mill at Gold Hill, A. Nolt proprietor, has tried coal from the Pioneer Company's claim, and pronounces it a success. This is the first time the coal has been tried in a furnace and it proved to be all that could be desired, burning brightly and throwing out intense heat.

The American Hill Quartz Mill was cleaned up yesterday and day before, after a month's run, and something over \$7,000 taken out. We did not learn the number of tons of rock crushed.—[Nevada Democrat.]

Watt, Tracy & Co., who have run a tunnel 185 feet down through the hill near the Toll House, on the Grass Valley road Nevada county, have struck into a load of blue gravel, which prospects very rich.

A miner named John Hill, who has been working on Rock creek and vicinity for many years, has lately made a fortunate strike. He was interested in some claims in the creek, but not being able to work them on account of high water, he occasionally employed his time in prospecting. About three weeks ago he found some rich ground at a low point making down to the creek, and immediately got some sluices and went to work. He hired two or three men, and up to last Saturday evening, had taken out over six thousand dollars. The diggings are not supposed to be extensive, but the fortunate discoverer has already made a respectable "pile." This ground which has proven to be so rich, has been worked over time and again by the miners of the vicinity, but no one thought of striking a pick in it with a view of prospecting. The miners have almost given up prospecting for surface diggings in this vicinity; but undoubtedly other claims will yet be found about Nevada as rich, and as easily worked, as that struck by Mr. Hill.—[Democrat.]

Smith & Co., who have been mining on Gold Flat, for a year or two past, discovered, a few days since, a lead of quartz—running through their diggings—of almost incomparable richness. They have traced it already about one hundred feet, and are getting out a few tons for crushing, in order to test its value. The district disposed quartz prospects from one to four miles to the south. They have several large boulders lying in front of their cabin, which are literally speckled with gold.—[Appeal.]

Calaveras County.—Meyers & Bushman have just made a two thousand dollar run in quartz; Williams & Co., another of \$2,500; Jones & Henry, of Camp Flores, have as much rich rock as was ever found in the State; the Paisano Company, are also taking out good rock, Carleton, House & Quintan, of Big Flat, have the past season taken out about \$12,000 await good weather to resume operations; Mr. Robinson has struck rock that prospects from fifty to one hundred dollars a ton, Read & Chick, have just struck another load which prospects from \$25 to \$100 per ton; Captain Belcher has, at a heavy expense, converted the crushing part of his machinery to a wet battery, which, with an improved amalgamator, makes his one of the best in the State. Foshler & Montz's new mill, on improved arastar principle, is doing a good business. Our Mexican miners seem to like this way of grinding better than any other. Kessler's mill is also in operation; Henry's mill, though somewhat injured by the last rains, can be repaired at a small expense; the Lamas mill (arastar) is not doing anything at present.

The Stockton "Independent" says that the Napoleon copper vein, in Calaveras County, has yielded considerable tonnage of copper, which have from time to time been shipped to Baltimore and to London. The earth surrounding this copper vein, on either hand, is impregnated with many different metals, and among them gold. During the past winter Mr. Hughes has washed out from the loose earth excavated in detaching copper ore, as much as six hundred ounces of gold.

Trinity County.—Franklin & Walls, at Smith's Flat, cleaned up \$500 for a thirteen day's run. The claim of Franklin & Maber yielded \$500 for fourteen days.

Kavanaugh & Goewey, on Weaver Creek, cleaned up six ounces from two day's and night's sluicing. They propose now to erect a hydraulic from Cheilan's ditch, which they expect to be able to clear off the same amount of ground in one day's labor.

On Texas Bar, Charley Soule & Co., run a cut into a small flat that had not before been prospected. The result of the week's work yielded \$110.

Mr. Jenkins informs us that Johnson & Co., on Eva's Bar, have got the water on again, and the miners are busy at work.

Mauel Rose & Co. took out 88½ ounces for a ten days run. Rockwell & Co., near the lower end of the flat, 25 ounces.

The Turner's Bar Boys cleaned up thirty-six ounces the last time. Jo Rose & Co., took out between forty and fifty ounces at their last cleaning up. Buchanan & Co., washed up drift dirt for two days and had nineteen ounces.

Mariposa.—A rumor is afloat that a most extraordinary placer has been found upon the copper mountain, to the left of the old trail leading from Bear Valley to Ridley's Ferry, on the river. An incredible amount of gold had been taken out, as is stated. The location is near the top of the mountain, and the gold is found in decomposed quartz.

The news of the discovery is confirmed fully. We have seen several who have seen the place, and they are which is represented as rich beyond calculation. It appears this place was first found by a Frenchman years ago, who, after taking out several thousand dollars alone, or assisted by an Indian or two, went to Ridley's Ferry, on the river. An incredible amount. He tried to describe the location of his discovery to some persons, but could only say that it was on a hill near Ridley's Ferry, from which could be seen Red Banks, the Ferry, Split Rock and other places, designated. It was known that the locality was on the west side of the river, and search was made for it without effect. But new parties, it appears, have stumbled upon it.—[Mariposa Gazette.]

The Mariposa "Gazette" says:

Quite a stir has been kicked up in town recently about the discovery of a new, and to appearances, rich placer mine near the trail that leads from Mariposa, via Neal's ranch. It was discovered by a Mr. Becknell, in the gulch that runs from the top of the rocky hill east of Neal's ranch, down to the Chowchilla, into which stream it empties itself near Brown's. This gold taken out is coarse hardly a piece less than a bit. \$50 was made in three hours Saturday by one person.

Placer.—The Placerville "News" says: A company, consisting of four men, known as the "New York Company," have taken up 800 feet in the creek, commencing where Mr. Booth's stable formerly stood, and extending up opposite the residence of Mr. Burns, which they intend to work this autumn or two, with the present one, a dump five hundred feet in length, just about completed. It is something over two feet in width and depth, and is calculated it will take the entire current of water now running in the stream. As a large portion of the old tailings, which have been prospected, yielded at the rate of four cents a pan, we anticipate that the company have the "deadwood" on wages at any rate.

The Dutch Flat "Equiper" learns that the winter floods have been of much advantage to mining claims in Indian Canon, near Iowa Hill, and that they are now paying better than for five years past.

Shasta.—At Jayceville, on the North Fork of Cottonwood, three hill claims are now yielding from seven to fourteen dollars to the hand per day. Hill claims in the vicinity have yielded as high as twenty-five to thirty dollars a day to the hand for months.

Sierra.—At Morristown the Highland Chief Company cleaned up lately, \$4,000 from two week's run. At Canon Creek two Frenchmen took out, recently, thirty-five ounces from one crevice, and were making twenty dollars per day to the man besides.

MESSRS. GODDARD & CO.'S AMALGAMATOR.

The mining community will notice a new feature in the construction of the new style Amalgamator just finished at the Pacific Foundry. These gentlemen claim to be the first who make these pans in sections so that their transportation may be facilitated. From experiments the inventors feel satisfied that they have accomplished much, and obviate many difficulties by their new style pan. One important advantage derived is; that they can be made much larger than most others in use; more particularly however is the manner in which it is propelled, and the mode with which it operates. Its motion is rapid, and most effectual in reducing ores by means of a muller and two conical rollers which latter revolve simultaneously with the muller. Recent trials have demonstrated that, the amalgamating process by these pans is by far the quickest and most expeditious now on record, doing its work most effectually and thorough. Twenty-five of these pans have been finished and will be shipped immediately to Washoe. Those interested in mining matters should by all means examine these pans, as they present important advantages, and portability; heretofore the great difficulty experienced was, that pans were made in one whole piece, which is dispensed with, the above pan is made in three pieces or castings. The false bottom and steam chest are securely bolted to the rim. Mr. Goddard is entitled to credit for constructing pans in this way.

Ludicrous Effects of a Comet.

In the year 1712, Mr. Whiston, having circulated the return of a comet which was to make its appearance on the 14th of October, at five minutes past five in the morning, gave notice to the public with this terrifying addition—that a total dissolution of the world by fire was to take place on the Friday following. The reputation which Mr. Whiston had long maintained, both as a divine and philosopher, left little or no doubt with the populace of the truth of his prediction. Several ludicrous events now took place. A number of persons about London seized all the barges and boats they could lay their hands on on the river Thames, very rationally concluding that when the conflagration took place there would be the most safety on the water. A gentleman who neglected family prayer for better than five years, informed his wife that it was his intentions to resume the laudable practice the same evening; but his wife, having engaged a ball at her house, persuaded her husband to put it off till they saw whether the comet appeared or not. The South Sea stocks immediately fell to 5 per cent., and the India to 11; and the captain of a Dutch ship threw all of his powder into the river, that the ship might not be endangered. The next morning, however, the comet appeared according to prediction, and before noon the belief was universal that the day of judgment was at hand. About this time 125 clergymen, were ferried over to Lambert, it was said, to petition that a short prayer might be planned and ordered there being none in the church service for that occasion. Three maids of honor burnt their collections of novels and plays, and sent to the bookseller to buy each of them a Bible and Taylor's Holy Living and Dying. The run upon the bank was so prodigious that all hands were employed from morning till night in discounting notes and handing out specie. On Thursday, considerably more than 7,000 kept mistresses were legally married in the face of several congregations, and to crown all, Sir Gilbert Heathcote, at that time head director of the bank, issued orders to all the fire offices in London, requiring them to keep a good lookout, and have a particular eye upon the Bank of England.

Silver.

Is more pure white than any other metal; it has considerable brilliancy, and takes a high polish. Its specific gravity varies between 10.4 which is the density of cast silver, and 10.5 to 10.6, which is the density of rolled or stamped silver. It is so malleable and ductile, that it may be extended into

leaves not exceeding the ten-thousandth of an inch in thickness, and be drawn into a wire much finer than a human hair. Silver melts at a bright red heat, at 1873° of Fahrenheit's scale, and when in fusion appears extremely brilliant.

The sheet metal for plated work is prepared by fitting together very truly, a short stout bar of copper, and a thinner plate of silver; when scraped perfectly clean they are tied strongly together with binding wire, and united by partial fusion without the aid of solder. The plated metals are then rolled out, and the silver always remains perfectly united and of the same proportional thickness as at first. Additional silver may be burnished on hot, when the surfaces are scraped clean as explained under gold; this is done either to repair a defect, or to make any part thicker for engraving upon, and the uniformity of the surface is restored with the hammer. In addition to its use for articles of luxury; the important service of copper plated with silver for the parabolic reflectors of the lighthouse must be overlooked; these are worked to the curve with great perfection by the hammer alone.

Protection of River Banks.

Much valuable land on the banks of rivers and rivulets is often laid waste by the encroachments of floods. A few words on this important subject seem to be necessary.—It may be laid down as a principle in natural science, that water is irresistible, and therefore it must not be resisted—it must be humored. All windings in streams are caused by resistance. The water, in rushing onward, dashes against a projecting stone or hard part on one of its banks; this sends it in an opposite direction and it strikes against whatever obstacle is presented. This process of interruption soon causes a mouldering of the banks in opposite directions, so that at length the water runs in a zig-zag or serpentine course. All this might have been avoided by allowing the water a perfectly free course.

The damage done to lands by flooding has led to numerous experiments for keeping the water in its channel, but seldom with any degree of success; because the attempts have been to hem in the current by sheer force. In all cases in which it is desirable to keep out tides or high floods from lands, the only secure method consists in giving the banks such a slope, that that they will give no resistance whatever but allow the water to rise and subside with equal ease and tranquility. As a general truth, the greater the slope, the better; and it should never be less than a foot and a half for every foot in the height. Employ no stones or stakes, or anything else, for the current to catch upon; but cover the slopes with smooth turf, at a season which will allow of its growth before the floods set in. If any patches get broken, let them annually be mended. To keep out high floods, the banks must be made correspondingly high. Artificial embankments in a flat country should assume the form of a long mound, sloping gradually on both sides.

Notwithstanding the obvious utility of this simple and unexpensive mode of protecting river banks, instances of damage are constantly occurring from projects of an opposite kind. Mr. Stephen mentions the following as one of many within his knowledge: "An embankment was thrown around the small island Mugdum, in the river Tay, to protect the land from being overflowed by the tide; but it was made so steep that the first spring tides levelled the greater part of it to the ground. A second attempt was made, with the additional expense of a stone wall facing the water, which shared the same fate with the former bank. Since these failures, a third embankment has been erected with nothing but the natural soil of the land, and the whole covered with thin turf. The length of the present slope next to the sea is five times the perpendicular height of the bank, and the inner slope three times; the water meeting no resistance, rolls down the long slope without doing any injury." To prevent high tides and freshets from entering the cross drains and ditches, and thus flooding the reclaimed land, it is often found necessary to fit all water-courses passing through the embankments with sluices and self-acting valves; and where the new land is exceedingly flat and low, even steam power is sometimes indispensable to carry off the stagnant waters.—Chambers' Information for the people.

S. BRANNAN,
REAL ESTATE, COMMERCIAL AND GENERAL
AGENT,
 NO. 420 MONTGOMERY STREET, BETWEEN
 SACRAMENTO AND CALIFORNIA.

BUILDING LOTS, STORES, HOUSES AND RANCHES FOR SALE AND TO LET.

MONEY to loan on Bond and Mortgage, or on approved securities. RENTS collected, and all other business appertaining to the above, attended to with promptness and dispatch.

ALL orders from the interior, for the purchase of goods or Merchandise promptly attended to.

PROPERTY FOR SALE!

TWO LOTS on Bush Street suitable for Homesteads, or Business purposes, 22 feet 6 inches each, by 67 feet in depth.

TERMS: Part cash, balance on time.

ALSO Choice Homesteads on Folsom and First Streets.

LOT on Folsom street, near the northeast corner of First street, 25 feet by 87 1/2 feet in depth.

ALSO, Lot on First street, near the northeast corner of Folsom, 25 feet by 87 1/2 feet in depth.

ALSO, desirable property for investment, on S. E. corner of Second and Mission streets, one hundred feet square, covered with eight Brick Stores, all rented to the first of next May.

ALSO, Pier No. 8, or Lot 649, on Stuart street, running through to East street. Street piled, capped and planked. Rented to the first of May, next.

ALSO, Lot No. 589, on the southeast corner of Market and Main streets 45 feet 10 inches on Market, and 137 1/2 on Main street.

FRENCH MERINO SHEEP!

BUCKS and EWES, FULL BLOOD. Also, 1,000 Ewes half blood French Merinos. Also, French Merinos, three-quarter blood. This Spring's Buck Lambs can be had by applying before the first of May.

ALSO, 2,560 acres of School Land Warrants of the 1st issue.

ALSO, Five Brick stores in Sacramento City, on Front street, opposite the Railroad and Steamboat Depot, between K and L streets. Part cash; balance on time.

ALSO, one Lot in Sacramento, 40 feet front by 150 feet in depth, on Front, between J and K streets.

ALSO, one Brick store in Sacramento, 24 feet by 60 feet in depth, on J street, between Front and Second streets.

ALSO, one valuable Lot for business, 50 feet square, on the corner of J and Front streets, Sacramento City.

ALSO, Two Farms, of 300 acres each, on the Feather River, opposite the town of Nicholas, 26 miles below Marysville. This property will be disposed of on long credit and low interest, with one quarter paid down. April-21.

A. S. HALLIDIE.

H. T. GRAVES.

A. S. HALLIDIE & CO.,
WIRE SUSPENSION BRIDGE BUILDERS,
and Manufacturers of
PATENT WIRE ROPE.

WIRE Suspension Bridges of any span and capacity erected, and material furnished.

Having been constantly engaged in the erection of Wire Suspension Bridges and Aqueducts for some years past, we are fully prepared to do such work satisfactorily at a low figure, and to guarantee PERMANENCE.

Parties who are about erecting bridges will find it greatly to their advantage to give us a call before deciding to build wooden structures, as the recent floods throughout the State have proven them to be wholly unsafe and unreliable. A number of our wire suspensions are now in use in different localities throughout the State, no one of which has been in the least effected by the freshets.

WIRE ROPE, for mining and ferry purposes, manufactured of any length and size required, being cheaper and better than hemp.

Scales of weights and strength with figures, furnished on application to the manufacturers. Send for a circular.

A. S. HALLIDIE & CO.,
 412, Clay street, San Francisco.

Woodworth & Brown's
CELEBRATED PIANOS.

THE UNDERSIGNED HAS JUST RECEIVED twelve Pianos from the above celebrated firm.

Many years' experience have convinced me that these Pianos have no superior, in Europe or America, in regard to tone, touch or durability; and I can bring sufficient proof of this, by parties in this city, having used Woodworth & Brown's pianos for the last ten years, and will testify that these pianos still retain their original tone and touch.

Mr. Chickering, of Boston, was himself the assigner of the Diploma, giving Messrs. Woodward & Brown the First Premium at the Massachusetts State Fair.

I have specimens on exhibition at the Art Gallery of Messrs. HAMILTON & LOVERING, Montgomery street, between Sacramento and California streets, where purchasers can buy a First Class Instrument, for a little more than New York cost.

I invite those wishing to have a superior piano, to examine the same before purchasing elsewhere.

REMEMBER! HAMILTON & LOVERING'S Art Gallery, Montgomery street, between Sacramento and California.

THE MINERS' COMPANION AND GUIDE.

This work has just been issued from the press by the publisher of this journal, and bids fair to become the standard work for the mining community on the Pacific Coast, for whose use it has been exclusively published, giving as it were a clear and distinct description of the art of mining and metallurgy in all its details. It is neatly printed on substantial paper, firmly bound of pocket size, and contains one hundred neatly engraved illustrations, comprising the latest improvements in mining implements, and the illustrations of new and useful processes for the separation of ores and pyrites. It is thus far the cheapest work published in this State—the price being only two dollars a copy.

This work treats especially of the Geology of California, —on the nature of deposits of metals and their ores, and the general principles of mining; timbering in shafts and mines; metals: their chemistry and geology; (complete treatises) for testing separating, assaying, the reduction of the ores, giving at the same time their density, color, specific gravity, and general characteristics, all of which is rendered in the most concise, simple and comprehensive manner. This part of the work will prove the most important to the people of this coast, as it will make every miner his own mineralogist and metallurgist. Another very important and highly useful part of the book forms the glossary of nearly two thousand technical terms and phrases, commonly used in the work, which are clearly explained and defined. We give a few interesting notices by the Press of this city and Sacramento:

THE MINER'S COMPANION.—We have received from the publisher, Mr. J. Silversmith, a new work entitled the "Miners Companion and Guide," being a compendium of valuable information for the prospector and miner. The book is of convenient form, and contains a number of illustrations and 232 pages of matter most interesting to all who are engaged in mining pursuits; and as a pocket manual or reference should be in the possession of every one engaged or immediately interested in the great source of California's wealth and prosperity, and comprises eight divisions or chapters, as follows: 1st. On the nature of deposits of the metals and ores, and the general principles on which mining is conducted; 2d. Manual of Mining and Metallurgy; 3. Metals—their chemistry and geology; 4th. Improved System of Assaying; 5th. The Geology of California, giving the results of partial observations made by competent geologists at various times since the settlement of California by Americans; 6th. Placer Mining, etc.; 7th. Processes for the Reduction of Gold and a Glossary of the technical phrases used in the work.—[Morning Call.

THE "MINER'S COMPANION."—We have received a copy of the Miner's Companion and Guide, a compendium of the most valuable information for the prospector, miner, mineralogist, geologist and assayer: together with a comprehensive glossary of technical phrases used in the work. Published by J. Silversmith, San Francisco. The book is of pocket size, and contains 232 pages. The first chapter of 69 pages is devoted to metalliferous veins and the manner in which the ore or rock is taken out. The second chapter, of 39 pages, contains a list of the valuable minerals and the forms in which they are found, with brief notes about the method of reducing the metals. The third chapter of 30 pages treat of assaying. These first three chapters contain much valuable information, all of which has been published in standard works on metallurgy and mining, such as Phillips, Ure, &c. The fourth chapter on the geology of California, contains thirty pages. The chapter on the mines of California contains seventeen pages, and that on the separation of gold from auriferous quartz, eleven pages—both of them original. The chapter on the reduction of silver ores, as practiced in Mexico and Europe, occupies seventeen pages. The glossary occupies thirteen pages, and finishes the book. The work is well printed, is convenient for handling and reference, and contains much information such as all good miners ought to possess, and such as, unfortunately, only a small portion of the miners do possess.—[Alt. California.

A BOOK FOR THE MINERS.—We have received from the publisher J. Silversmith, of the Mining and Scientific Press, a copy of the "The Miner's Companion and Guide," a compendium of most valuable information for the prospector, miner, geologist, mineralogist and assayer; together with a comprehensive glossary of technical phrases used in the work. It is a neat duodecimo volume of 232 pages, profusely illustrated with cuts of machinery, mining operations, etc. The title of the book, which we have quoted at length, fully indicates its character: and from a cursory examination of its contents, we have no doubt it will prove a valuable assistant to the class of persons for whose use it is designed.—[Herald.

NEW AND VALUABLE MINING BOOK.—We have been presented with a new mining book, just published by the enterprising publisher and proprietor of the "Mining and Scientific Press," of San Francisco. The title of the work, the Miner's Companion and Guide, and treats of California Mines exclusively. It will prove a most invaluable work for the prospector, miner, geologist, mineralogist and assayer; it contains also, the latest and most approved process for separating gold, silver and pyrites. In the latter portion of the work, will be found a glossary of technical terms. The whole is neatly printed, handsomely illustrated, and firmly bound, and may be had at any of the book stores of this city. It is the best work yet produced of its kind, and no doubt will meet with great sale.—[San. News.

A VALUABLE WORK FOR THE MINERS.—Our thanks is due to Mr. Silversmith of the "Mining and Scientific Press," for a copy of the "Miner's Companion and Guide," being a compilation of most useful information, together with a

glossary, giving the definition of all the terms made use of in the work, many of which are not familiar to our miners, and which adds much to its intrinsic worth. The work is well got up, convenient in size, and is of such a comprehensive nature, that it will no doubt meet with ready sale, throughout all our mining towns for its merits and lucidness. We earnestly commend it to all those who are practically interested in bringing to light from Mother Earth's treasured its hidden treasures.—[Union Temperance Journal.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207,766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our renders with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the state at large. The charges are as follows:

For parting silver from gold when gold is below 300-1000ths. fine.....3cts per oz.
" from 300-1000ths. to 750-1000ths fine. 7cts "
" " 750-1000ths to 950-1000ths " .14cts "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce 1/2 per ct. on gross value of all gold contained for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
 301 " 500, 7cts, " " "

DEPOSITS FOR FINE BARS.

\$1 16-4-11ths cents. per standard ounce, 1/2 per ct. gross value of silver for making bars; also when gold is contained 1/2 per ct. on gross value of gold for coining. Refining charges as in purchases.

BARs SOLD FROM REFINERY.

\$1 21cts. per standard oz. 1/2 per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16-4-11ths. per standard oz. 1/2 per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16-4-11ths. cents per standard ounce. 1/2 per ct. gross value of deposit for making bars.

In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of 1/2 per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

U. S. BRANCH MINT, Nov. 6th, 1861.

On and after the 15th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and be imposed on all bullion deposited for coinage or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

ROBT. J. STEVENS, Superintendent.

WILLIAM L. DUNCAN, NOTARY PUBLIC,

—AND—

REAL ESTATE AGENT.

OFFICE,

In Telegraph Office, Montgomery Block.

REAL ESTATE for sale in all portions of the city. Loans negotiated on Real Estate and other securities. Deeds, mortgages and Bonds, accurately drawn up. Soldiers' Pay Claims made out and purchased on liberal terms; and claims against the United States and State Governments collected. FUL

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to before extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Shoes and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouing Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at McCall's mill in this city.

Knox's Amalgamator, with the latest improvements; Howland & Hanscom's Amalgamator; Goddard's Tub, lately improved, in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Fat Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.
Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GO DDALD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up set at work Crushing the Ore, in Ten Hour after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco
Ogdon & Wilson. }

SPECIAL NOTICE.

HIGHLY IMPORTANT INVENTION IN DENTISTRY.—Dr. D. STEINBERG begs leave to announce to the citizens of this city, that letters patent for his invaluable improvements in mechanical Dentistry were granted him on the 12th of November last.

This invention consists in the application of GUM ENAMEL to gold plates for artificial teeth, and acknowledged to surpass all others in use, for their beauty, style and exactitude of fit; their weight compared with others, is less but are far more durable by the addition of the gum enamel. Specimens of this valuable invention may be seen and examined at the dental office of the undersigned, No. 648 Washington street, near Kearny. Great care and attention is devoted to the perfect filling of teeth. Teeth extracted by the new process.

STEINBERG & SICHEL,
Practical Dentists,
648 Washington st., near Kearny.

REMOVAL OF THE DEAD

From Yerba Buena Cemetery.

AS THE DEAD IN YERBA BUENA CEMETERY WILL BE REMOVED IN a short time by the authorities, those having relatives or friends there wish disinterred, are informed that I have the most complete registry in existence of graves in that Cemetery, having added to my own records, by purchase, the books of the late City Sexton. Permits for disinterment obtained from the proper authority, and orders carefully attended to at reasonable charges.

Everything requisite for Funerals supplied at the shortest notice.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME IV.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 3d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$5.

Two Copies for Six Months, \$16.

Two Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80

Names can be sent in at different times and from different Post-offices

Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Lock Box 537, P. O.

Room 24, (formerly) U. S. Court Building, Corner of Washington streets, San Francisco.

WHILE YOU HAVE THE MONEY,

MAKE SURE OF A HOME!

NEVER HAZARD THE LAST DOLLAR!

To Cariboo and Salmon River Miners, and all others who wish to purchase LOTS in San Francisco with a PERFECT TITLE:

ED. The undersigned will sell Building Lots for from \$10 to \$200. Also, 50-acre lots and entire Blocks of the most beautiful gardening lands in the city and county of San Francisco, on the line of and AT THE WEST-END DEPOT OF THE SAN FRANCISCO AND SAN JOSE RAILROAD. Persons desiring to invest a few dollars, or hundreds, or thousands of dollars, would do well to call on the undersigned, AS HE DEALS ONLY IN LAND WITH A PERFECT TITLE, to wit: those held under

A PATENT OF THE UNITED STATES!

Persons residing in the interior, or who are about to go to the Cariboo or Salmon River Mines, can purchase this property and leave it without any fear of adverse claims or titles springing up in their absence.

The undersigned will, if desired, give his personal attention to the assessing, paying of taxes, etc., on all lots purchased from him, and will forward to each non-resident purchaser his tax receipts, free of all cost save the actual amount of the taxes.

Office—No. 19 third floor of Naglee's Building, (south-west corner of Merchant and Montgomery streets.) ois-1f

HARVEY S. BROWN.

Removal!

F. A. HASSEY, Notary Public, and REAL ESTATE AND HOUSE AGENT, has removed from No. 406 to No. 428 Montgomery street, adjoining H. Heitsch's Book, near Sacramento street. ap11f

MINING AND SCIENTIFIC PRESS.

Caveats and Patent Applications.

We are enabled through our legal connection at Washington and European Patent Bureaus to obtain Letters Patent for inventors and discoverers on this Coast, WITH LESS EXPENSE, and GREAT ECONOMY of TIME, than any other firm in the United States. Those requiring our services will please address us by stating the nature of their invention with a sketch, or drawing, thereof, also a model if possible. The Government fees are as follows:

On every application for a design, for three years and six months, \$10; on every application for a design, for seven years, \$15; on application for a design, for fourteen years, \$30; on every caveat, \$10; on every application for a patent, \$15; on issuing each original patent, \$20; on filing a disclaimer, \$10; on every application for a reissue, \$30; on every additional patent granted on a reissue, \$30; on every application for an extension, \$50; on the grant of every extension, \$50; on appeal to the commissioner from examiners in chief, \$20; on every appeal to the judges of circuit court, D. C., \$25.

Illustrations and Engravings.

WOOD ENGRAVING.—This office undertakes the preparation of Illustrated Catalogues and Circulars for Engineers, Agricultural Implement Makers Hardware Dealers, Jewellers, Printers, Patentees, and other kinds of Wood Engraving; and, from considerable experience in illustrating Mechanical Journals, can insure accuracy of detail both in the Drawing and Engraving. This is secured by employing professed Mechanical Draughtsmen in the preparation of the Wood Blocks.—Drawings taken from Photographs—Estimates furnished.

Address JULIUS SILVERSMITH,

Patent Solicitor, State Capitol Building, cor. Wash. and Battery, San Francisco, Cal.

Banham's Excelsior Quartz Grinder. Pulverizer and Amalgator.

Homesteads for the Mechanic and Laborer.

In a former edition of the PRESS we gave some details of the process of Mr. Banham for the separation and amalgamation of gold and silver ores as well as (pyrites) sulphurets. The grinding apparatus has been most successfully applied for more than three years in this State, and in every instance gives satisfaction. As will be seen in the illustration, a circular trough is fitted upon a substantial frame, in the centre of which an upright piece revolves, to which four arms are affixed, to each of which arm, is attached a drag, said drags fit the circular trough, and as the substances to be reduced are introduced they are almost simultaneously pulverized. Mercury is also employed in this trough, and the drags are provided with currogations to admit of the mercury passing longitudinally under said drags.

The Hydro-Electro apparatus, is the Second process. With this amalgamator no roasting of the ores is required; the pulverized ore is allowed to pass through the perpendicular (X) shaped horizontal piece which is immersed in a mercury chamber. An electric battery infuses electro-magnetism into the mercury, thus every atom of water, debris, metal or chemicals passing through the eyllinder is acted upon, the finer particles of gold, silver or other metallic substances, are held in the mercury as an amalgam. Mr. Banham has applied through this office for a patent, and any information will be given respecting his process and machine by the editor of this journal.

IS THE SUN INHABITED?—Sir David Brewster makes the following remarks relative to the sun: "So strong has been the belief that the sun cannot be a habitable world, that a scientific gentleman was pronounced by his medical attendant insane, because he had sent a vaper to the Royal Society in which he maintained that the light of the sun proceeded from a dense and universal aura, which may afford ample light to the inhabitants beneath, and yet be such a distance aloft as not to be among them; that there may be water and dry land there, hills, dales, rain and fair weather, and that as the light and the seasons must be eternal, the sun may easily be conceived to be by far the most blissful habitation of the whole system. In less than ten years after this apparently extravagant notion was considered as a proof of insanity, it was maintained by sir William Herschel as a rational and probable opinion, which might be deducible from his own observations on the structure of the sun.—*Butte Record.*

WE listened with pleasure to our esteemed friend Wm. H. White, formerly well known as W. Bernard, now performing at the Varieties, whose versatility as a interrogator in the minstrel performances is most essential. His odd and quaint ideas and expressions are at times so funny as to cause us to laugh a whole week. The performances at this house are of the legitimate style and draw well. Obscene language and vulgarities are not indulged in.

A word on this subject may not be out of place since this subject does not come strictly within our sphere; but while we seek the interest, progress and advancement, of our industrious mechanics, laborers, and artisans, we must at the same time point out to him a way by which he may invest his earnings, and in providing a home for his family. After a sojourn of seven years in this city, we have watched with considerable interest the changes that have been wrought in every particular, the immense and beautiful structures in Montgomery street near Market were in those days barren sand hills! A 50 vara lot was not valued above a few hundred dollars, whereas their value now, is counted by thousands of dollars. We imply by this that the opportunity in acquiring property of this nature is presented this day, and no time should be lost by those who have saved a small sum to avail themselves of the chance. We take for instance the Real Estate offered by Mr. H. S. Brown near the Mission, ranging from \$100 to \$250 per lot, being one of the finest tracts of land to be found in any country, the title too, we understood, being perfect. That the city is wending its way in that direction is too well established, and this property must eventually become valuable like any property on Montgomery street. The San Francisco and San Jose Railroad, are building a depot near this property, which we consider a step towards its immediate improvement, and the completion of the road, it is anticipated by the contractors in running order is set at farthest, till the 1st of January 1863. We do not directly advise persons to invest in this property, particularly, although we have sufficient evidence of the genuineness of the title, to Mr. Brown's Estate, in fact the last that can be had,—being an original Spanish grant. Besides this opportunities are sometimes offered at auction sales where town lots and homesteads are offered at reasonable prices. The mechanic who has a family is by the laws of this country protected in the possession of a homestead against attachment and execution, hence he should not be without it.

NEVADA TERRITORY.

At the East Walker District there were some thirty or forty miners who had four mills in operation. Mr. Bense and party brought in \$50 worth of gold amalgam, the first obtained from the crushing by the mills. This amalgam is from about twenty tons of rock more than half the gold in which was not saved on account of imperfect machinery.

Messrs. Fock and McGuire, of the American Company, Wisconsin District, brought in on Sunday last, from their gulch claim, four and a half ounces of gold dust, the result of one day's sluice washing. This dust sells here at \$17 50, and is worth \$19 50 at the mint. There were four men engaged and the sluicing was difficult on account of the ice.

The bill introduced into the House of Representatives, by Judge Cradlebaugh, for the establishment of a Mint in Nevada Territory, has been favorably reported on by the Committee of Ways and Means, and an appropriation recommended.

HARVEY S. BROWN.
Feb.

SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San Francisco.

It is generally much better to apply for foreign patents simultaneously with the application here; or if this cannot be conveniently done, as little time as possible should be lost after the patent is issued, as the laws in some foreign countries allow patents to any one who first make the application, and in this way many inventors are deprived of valid patents for their own inventions. Many valuable inventions are yearly introduced into Europe from the United States, by parties ever on the alert to pick up whatever they can lay their hands on, which may seem useful.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

CAUTION.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall

into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Address, J. SILVERSMITH,
GOVERNMENT HOUSE,
SAN FRANCISCO.

N. B.—T. R. FENWICK, Esq., recently of the *Scientific American*, and for over fourteen years a successful patent solicitor in Washington, D. C., is associated with and will hereafter transact all business pertaining to patents for us, at the patent office in Washington city. For instructions and the new law regulating patents, we refer the inventor to the above.

Miners, Inventors, Agriculturalists, Capitalists and Mechanics, will find it to their advantage to subscribe for the MINING AND SCIENTIFIC PRESS—being the only journal of that class published upon this continent. Issued every Saturday at four dollars per annum.

BOUND VOLUMES of the above journal can be had on application, also any back numbers.

THE METROPOLITAN THEATRE.

We present to our readers in this number, a beautiful illustration of this magnificent Temple of Thebes, which recently sprang from its long sleep into active life again, under new and happier auspices than of old. It is now two weeks since the rebuilding of this splendid edifice, destroyed by fire some years ago, was completed and its massive doors thrown open to an admiring public. It opened, to use the expression of a cotemporary, in "a blaze of glory"—and every night its spacious interior has been crowded from pit to dome by enthusiastic audiences, who thus testify their gratification at being supplied with what had so long been felt a public necessity, viz., a *First Class Theatre*. The Metropolitan is the largest and handsomest theatre in the State. Its capacity is apparent when we state the fact that it can with ease hold \$1700! The upper circle alone can seat 800 persons. The seats are so admirably arranged that every person in the house can see the whole stage, and the law of acoustics has so implicitly been obeyed by the gifted architect, that the faintest whisper from the stage can be heard in every part of the edifice. Elegantly, but not too elaborately adorned, the interior is a triumph of good judgment and taste, over the trashy, cheap and vulgar display too often seen in the decorations of our theatres. We have never seen in any part of the world, a dramatic edifice better lighted or as well ventilated as this, and in every particular it is all that can possibly be desired and more than was ever expected by the public. In the opening address, Mrs. Hosmer felicitously wrote:

The dread and all-reckless demon, Fire,
Strewed in one night the Drama's funeral pyre,
But art and industry, awakening, rise,
A second Phoenix soars proudly up toward the skies;
A stately dome than fell beneath the flame
Springs into life, and takes its place and name.
Creative genius and adorning taste
Have reared a pile at once ornate, superb and chaste.
And sought through the pleased eye, to touch the heart,
Ever responsive to the ennobling art.

John Torrence & Co. deserve the cordial thanks of the community, not alone for building this grand theatre, but for placing upon the boards such first-class talent as they have. Miss Joey Gougenheim, Mr. James Stark, Mrs. Judah, Miss Mowbray, Mr. John Wood and Mr. Harry Courtaine, form a galaxy of talent, before which the light of all other companies in this State must pale. The Acting and Stage Manager is Mr. Charles Tibbets; the Stage Director, Mr. James Dowling, and Conductor of Orchestra, Mr. Chas. Schultz—all eminent in their several spheres of

action. We cannot conclude our remarks concerning the Metropolitan Theatre, without heartily wishing that it may long and proudly stand far above and beyond all its present competitors—the pride and glory of the Pacific Coast.

INDIAN WEALTH IN HORSES.—A correspondent of a Portland paper writing from the Nez Perces country, says: The generality of the Nez Perces horses are much finer than any Indian horses I have yet seen. Still there are many which are not better than the ordinary Caynse. A great many are large, fine bred American stock, with fine limbering withers, sloping well back, and are uncommonly sinewy and are sure-footed. Their best gaits are usually a gallop and walk. I have seen thousands of the horses grazing on the mountain, apparently the property of a few lodges. In one place—to be more exact—these lodges of common Indians calling themselves poor—have six or seven hundred of them, running from common Caynse to elegant chargers, fit to mount a prince. They value their fine horses beyond all price, and will not sell them unless forced to. Of those which they have for sale the range of prices may be from \$15 to \$100 apiece. I think that the 4,000 Nez Perces may be set down as the owners of at least 5000 horses.

CONFLAGRATION.—At three o'clock yesterday afternoon, a destructive fire broke out on Simmonds street, between Howard and Folsom. The loss amounted to nearly \$20,000.

PURE NATIVE SONOMA WINES.

RED, WHITE AND SPARKLING.
From Lachryma Montis Vineyard.

MANY FAMILIES AND OTHERS BEING DESIROUS OF PROCURING MY Wines, and having now a large quantity accumulated of the vintage of the last five years, I have determined on introducing them into the market, for which purpose I have appointed A. S. Lowndes & Co. my sole agents, of whom the wines may be obtained in their pure state, as they come from my vaults in Sonoma.

At the Depot, 617 Montgomery street, from this time we shall have in store a constant supply of all classes of the Lachryma Montis Wines, and parties purchasing from us may rely on obtaining the pure offspring of the grape. First Premiums and Diplomas have been awarded to Gen. Vallejo for specimens of his Wines, exhibited at the various Fairs held in the different parts of the State during the past four years, and having now attained some age, are for the first time brought into market. As dinner wines, and a general healthy beverage for this climate, the Lachryma Montis Wines cannot be surpassed. For sale in quantities to suit by

A. S. LOWNDES & CO., Agents,
617 Montgomery street, opposite Montgomery Block, San Francisco.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC
PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME III.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 2d 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!
This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 50. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

PATENT LAW AMENDMENT OF 1861.

How to Obtain Patents Under the New Law.

The Patent Law Amendment Act, passed March 4th, 1861, and now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The first question, therefore, that presents itself to the inventor who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the *MINING AND SCIENTIFIC PRESS*. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us as secret, and strictly confidential.

PRELIMINARY EXAMINATIONS.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search, made at the U. S. Patent Office, Washington, through the medium of our house in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enabled to modify his claims and expectations accordingly. Many other obvious advantages attend the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his, and used for the same purpose has ever been patented or not in this country.

Parties desiring the Preliminary Examination are requested to remit the fee (\$10), and furnish us with a sketch and description of the invention.

CAVEATS.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for this service varies from fifteen to twenty dollars. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will at times find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

EXPENSE OF APPLYING FOR A PATENT, REJECTIONS, ETC.,

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of governments that

discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is generally thirty dollars; but the charge is higher if unusual labor is involved. If the patent is granted no further agency expenses ensue. If the application is rejected we cause a thorough investigation to be made into the reasons presented by the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

No charge whatever will be made unless we succeed in procuring the grants of Letters Patent.

GENERAL REMARKS.—For the information of applicants, we would state that some agents are in the habit of charging for the preparation of the case, and having no further facilities, decline all investigation or prosecution when rejected. Others, also, having no facilities of their own, advise their clients to go to the expense of procuring official copies of the drawings and specifications of all the references. Again, others are in the habit of charging a high price at the outset, in which they include the cost of prosecuting the case, if by them deemed necessary. Under this system, if the patent issues, or is justly rejected, no further prosecution is needed; but the inventor has paid full price for a service not wanted and never rendered.

Our object in making the above statement is, not to reflect upon the manner in which other agents conduct their affairs, but simply to have our own method of doing business clearly understood.

The system adopted by us works well, gives general satisfaction, and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorneys, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in hundreds of such cases. Our terms for such cases are very moderate.

MODELS, REMITTANCES, ETC.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

Where the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely, J. Silversmith, Government House, Rooms 20 and 21, San Francisco. Prepay the expense, and send express receipt to us by mail.

Simultaneously with the model, the inventor should also send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco payable to our order. Always send a letter with the model, and also with the remittance, stating the name and address of the sender. We sometimes receive envelopes containing money, but without any name or explanation; models are also frequently sent us from equally unknown sources.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the reception of model and Government fee, the case is duly registered upon our books, and the application proceeds with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature, and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due, and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued, the applicant will be notified to remit the last installment of the Government fee, namely twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless the invention is one of great complication; the business can as well be done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself, must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

RETURN OF MODELS.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office. This law applies also to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

DESIGNS, TRADE MARKS, LABELS, ETC.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving, or stamping upon silks, calicoes, carpets, oil cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso rilievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc. The terms for which these patents are granted varies according to the fee paid by the applicant, as follows:

Patent for 3½ years.....	\$10
" 7 "	15
" 14 "	30

No models are required. But duplicate drawings must be furnished, together with the usual specification, petition and affidavits, which, to render the patent of value, should be prepared with the utmost care.

Our facilities for the prompt preparation and securing of patents are of the most extensive character and our charges are very moderate.

INFRINGEMENTS.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest or prohibition from the employment of his machinery, shop, works, factory, and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable, either collectively or individually.

Having access to all the patents, models, public records, drawings, and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Address all letters of inquiry to J. Silversmith, Government House, rooms 20 & 21, San Francisco.

APPEALS.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the district of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal, and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services can be retained on moderate terms.

INTERFERENCE.

If an inventor happens to apply for a patent when another application for a similar device is pending at the Patent Office, the two cases are declared by the Commissioner to interfere, and each party is notified to present evidence as to the date when he first invented the thing. He who proves the priority of the invention receives the patent, and the other applicant is rejected.

Even after the patent has been granted, another inventor may come forward and apply for a patent for the same device; and if he can prove priority of invention the Commissioner will issue a patent to him.

The taking of evidence in interference cases is a sort of private inquest. It is not necessarily a Court proceeding. Subpoenas can be issued and compulsory process employed to cause the parties to testify.

The management of interference is one of the most important in connection with Patent Office business.

Our terms for attention to interferences are moderate, and dependent upon the time required. Address all letters to J. Silversmith, Government House, San Francisco.

PACIFIC PATENT AGENCY,

J. SILVERSMITH, Solicitor, Government House, San Francisco.

NEW PATENT LAW.

AN Act in addition to an "An Act to promote the progress of the useful arts."

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that the Commissioner of Patents may establish rules for taking affidavits and depositions required in cases pending in the Patent Office, and such affidavits and depositions may be taken before any justice of the peace or other officer authorized by law to take depositions to be used in the courts of the United States, or in the State courts of any State where such officer shall preside; and in any contested case pending in the Patent Office it shall be lawful for the clerk of any court of the United States for any district or territory, and he is hereby required, upon the application of any party to such contested case, or the agent or attorney of such party to issue for any witnesses residing or being within the said district or territory, commanding such witnesses to appear and testify before any justice of the peace, or other officer as aforesaid, residing within the said district or territory, at any time and place in the subpoena to be stated; and if any witness after being duly served with such subpoena shall refuse or neglect to appear, or, after appearing shall refuse to testify (not being privileged from giving testimony), such refusal or neglect being proved to the satisfaction of any Judge of the court whose clerk shall have issued such subpoena, said Judge may thereupon proceed to enforce obedience to the process, or to punish the disobedience in like manner as any court of the United States may do in case of disobedience to process of subpoena ad testificandum issued by such court; and witnesses in such cases shall be allowed the same compensation as is allowed to witnesses attending the court of the United States; provided that no witness shall be required to attend more than forty miles from the place where the subpoena shall be served upon him to give a deposition under this law; provided, also that no witness shall be deemed guilty of contempt for refusing to disclose any secret invention made or owned by him; and provided, further, that no witness shall be deemed guilty of contempt for disobeying any subpoena directed to him by virtue of this act, unless his fees for going to, returning from, and one day's attendance at the place of examination, shall be paid or tendered to him at the time of the service of the subpoena.

Sec. 2. And be it further enacted, that for the purpose of securing greater uniformity of action in the grant and refusal of letters patent, there shall be appointed by the President, by, and with the advice and consent of the Senate, three examiners-in-chief, at an annual salary of three thousand dollars each, to be composed of persons of competent legal knowledge and scientific ability, whose duty it shall be, on the written petition of the applicant for that purpose being filed, to revise and determine upon the validity of decisions made by examiners when adverse to the grant of the letters patent; and also to revise and determine in like manner upon the validity of the decisions of examiners in interference cases, and when required by the Commissioner in applications for the extension of patents, and to perform such other duties as may be assigned to them by the Commissioner; that from their decisions appeals may be taken to the Commissioner of Patents in person, upon payment of the fee hereinafter prescribed; that the examiners-in-chief shall be governed in their action by the rules to be prescribed by the Commissioner of Patents.

Sec. 3. And be it further enacted that no appeal shall be allowed to the examiners-in-chief from the decisions of the primary examiners, except in interference cases, until after the application shall have been twice rejected; and the second examination of the application by the primary examiner, shall not be had until the applicant, in view of the references given on the first rejection, shall have renewed the oath of invention, as provided for in the seventh section of the act entitled "An act to promote the progress of the useful arts, and to repeal all acts and parts of acts heretofore made for that purpose," approved July 4th, 1836.

Sec. 4. And be it further enacted that the salary of the Commissioner of Patents, from and after the passage of this act, shall be four thousand five hundred dollars per annum, and the salary of the chief clerk of the Patent Office shall be two thousand five hundred dollars, and the salary of the librarian of the Patent Office shall be eighteen hundred dollars.

Sec. 5. Be it further enacted, that the Commissioner of Patents is authorized to restore to the respective applicants, or, when not removed by them, to otherwise dispose of such of the models belonging to rejected applications as he shall not think it necessary to be preserved. The same authority is also given in relation to all models accompanying applications for designs. He

is further authorized to dispense in future with models of designs when the design can be sufficiently represented by a drawing.

Sec. 6. And be it further enacted, that the tenth section of the act approved the 3rd of March, 1837, authorizing the appointment of agents for the transportation of models and specimens to the patent office, is hereby repealed.

Sec. 7. And be it further enacted, that the Commissioner is further authorized, from time to time, to appoint, in the manner already provided for by law, such an additional number of principal examiners, first assistant examiners, and second assistant examiners, as may be required to transact the current business of the office with dispatch, provided the whole number of additional examiners shall not exceed four of each class, and that the total annual expenses of the patent office shall not exceed the annual receipts.

Sec. 8. And be it further enacted, that the Commissioner may require all papers filed in the patent office, if not correctly, legibly, and clearly written, to be printed at the cost of the parties filing such papers; and for gross misconduct he may refuse to recognize any person as patent agent, either generally or in any particular case; but the reasons of the Commissioner for such refusal shall be duly recorded, and subject to the approval of the President of the United States.

Sec. 9. And be it further enacted, that no money paid as a fee on any application for a patent after the passage of this act shall be withdrawn or refunded, nor shall the fee paid on filing a caveat be considered as part of the sum required to be paid on filing a subsequent application for a patent for the same invention.

That the three months' notice given to any caveator, in pursuance of the requirements of the twelve section of the act of July 4th, 1836, shall be computed from the day on which such notice is deposited in the post office at Washington, with the regular time for the transmission of the same added thereto, which time shall be endorsed on the notice; and that so much of the thirteenth section of the act of Congress, approved July 4th, 1836, as authorizes the annexing to letters patent of the description and specification of additional improvements, is hereby repealed, and in all cases where additional improvements would now be admissible independent patents, must be applied for.

Sec. 10. And be it further enacted, that all laws now in force fixing the rates of the Patent Office fees to be paid and discriminating between the inhabitants of the United States, are hereby repealed, and in their stead the following rates are established:

On filing each caveat, ten dollars.

On filing each original application for a patent except for a design, fifteen dollars.

On issuing each original patent, twenty dollars.

On every appeal to the examiners-in-chief to the Commissioner, twenty dollars.

On every application for the re-issue of a patent, thirty dollars.

On every application for the extension of a patent, fifty dollars; fifty dollars in addition, on the granting of every extension.

On filing each disclaimer, ten dollars.

For certified copies of patents and other papers, ten cents for one hundred words.

For recording every assignment, agreement, power of attorney, and other papers, of three hundred words or under, one dollar.

For recording every assignment and other papers over three hundred and under one thousand words, two dollars.

For recording every assignment or other writing, if over one thousand words, three dollars.

For copies of drawings, the reasonable cost of making the same.

Sec. 11. And be it further enacted, that any citizen or citizens, or alien or aliens, having resided one year in the United States, and taken the oath of his or her intention to become a citizen or citizens, who, by his, or her, or their own industry, genius, efforts or expense, may have invented or produced any new or original design for manufacture, whether of metal or other material or materials, and original design for a bust, statue or bass relief, or composition in the basso-relievo, or any new and original impression or ornament, or to be placed on any article of manufacture, the same being formed in marble or other material, or any new or useful pattern, or print, or picture, to be either worked into or worked on, or printed, or painted, or cast, or otherwise fixed on any ar-

ticle of manufacture, or any new and original shape or configuration of any article of manufacture, not known or used by others before his, her, or their invention or production thereof, and prior to the time of his, her, or their application for a patent therefore and who shall desire to obtain an exclusive property or right therein to make, use and sell, and vend the same, or copies of the same to others, by them to be made, used and sold, may make application in writing to the Commissioner of Patents expressing such desire; and the Commissioner, on due proceedings had, may grant a patent therefor, as in the case now of application for a patent, for the term of three and a half years, or the term of seven years, or the term of fourteen years, as the said applicant may elect in the term of his application, provided that the fee to be paid in such application shall be for the term of three years and six months, ten dollars; for seven years, fifteen dollars; and for fourteen years, thirty dollars; and provided that the patentees of designs under this act shall be entitled to the extension of their respective patents for the term of seven years from the day on which said patents shall expire, upon the same terms and restrictions as are now provided for the extension of letters patent.

Sec. 12. And be it further enacted that all applications for patents shall be completed and prepared for examination within two years after filing the petition, and in default thereof they shall be regarded as abandoned by the parties thereto, unless it be shown to the satisfaction of the Commissioner of Patents that such delay was unavoidable; and all applications now pending shall be treated as if filed after the passage of this act; and all applications for the extension of patents shall be filed at least ninety days before the expiration thereof, and notice of the day set for the hearing of the case shall be published as now required by law, for at least sixty days.

Sec. 13. And be it further enacted, that in all cases where an article is made or vended by any person under the protection of letters patent, it shall be the duty of such person to give sufficient notice to the public that said article is so patented, either by fixing thereon patented, together with the day and year the patent was granted, or when, from the character of the article patented, that may be impracticable, by enveloping one or more of said articles, and affixing a label on the package or otherwise attaching thereto a label, on which the notice with the date is printed; on failure of which, in any suit for the infringement of letters patent by the party failing so to mark the article, the right to which is infringed upon, no damage shall be recovered by the plaintiff except on proof that the defendant was duly notified of the infringement, and continued after such notice to make or vend the article patented. And the sixth section of the act entitled "An act in addition to an act to promote the progress of the useful arts," and so forth, approved the 29th day of August 1842, be and the same is hereby repealed.

Sec. 14. And be it further enacted, that the Commissioner of Patents he and he is hereby authorized to print, or in his discretion to cause to be printed, ten copies of the description and claims of all patents which may hereafter be granted, and ten copies of the drawings of the drawings of the same, when drawings shall accompany the patents; provided the cost of printing the text of said descriptions and claims shall not exceed, exclusive of stationary, the sum of two cents per hundred words for each of said copies, and the cost of the drawing shall not exceed fifty cents a copy; one copy of the above number shall be printed on parchment, to be affixed to the letters patent; the work shall be under the direction and subject to the approval of the Commissioner of Patents, and the expense of the said copies shall be paid for out of the patent fund.

Sec. 15. And be it further enacted, that printed copies of the letters patent of the United States, with the seal of the Patent Office attached thereto, and certified and signed by the Commissioner of Patent shall be legal evidence of the contents of said letters patent in all cases.

Sec. 16. And be it further enacted, that all patents hereafter granted shall remain in force for the term of seventeen years from the date of issue; and all extensions of such patents is hereby prohibited.

Sec. 17. And be it further enacted, that all acts and parts of acts heretofore passed which are inconsistent with the provisions of this act be and the same are hereby repealed.

Approved March 21, 1861.
